

Harold's Cryptology Cheat Sheet

17 December 2022

Definitions

Term	Definition
Cryptology	The study of cryptography and cryptanalysis
Cryptography	Methods of encipherment (secret techniques)
Cryptanalysis	Methods of decipherment (code breaking)
Plain	Plain text message to be encrypted
Cipher	Encrypted text message to be decrypted
Key	Secret string or set of numbers used to encrypt plain text
Steganography	Information hiding in files, like JPG images

Text to Numbers Encoding

Letter	Number	Letter	Number
A	00	N	13
B	01	O	14
C	02	P	15
D	03	Q	16
E	04	R	17
F	05	S	18
G	06	T	19
H	07	U	20
I	08	V	21
J	09	W	22
K	10	X	23
L	11	Y	24
M	12	Z	25
		<space>	26

Cipher Methods

Method	Concept	Example	How
Shift	<p>m = plain text message c = cipher text e.g., ("A" = 0, "B" = 1, ...) $0 \leq a, b < n$ $\gcd(a, n) = 1$ (coprime)</p>		Modular Arithmetic for all three (see Harold's Modular Arithmetic Cheat Sheet)
	Multiply and shift, then wrap	Affine Ciphers	$c = (am + b) \text{ MOD } n$ $m = (a^{-1}(c - b)) \text{ MOD } n$ <p>To find a^{-1}, solve for r: $(c - b) \cdot r \equiv 1 \pmod{n}$ Since $r = a^{-1}$, then $a^{-1}am = m \pmod{n}$</p>
	Shift and wrap	Caesar Cipher	$c = (m + b) \text{ MOD } n$ $m = (c - b) \text{ MOD } n$ <p>Same as Affine with $a = 1$.</p>
	Multiply and wrap	Decimation Cipher	$c = (am) \text{ MOD } n$ <p>Same as Affine with $b = 0$ and "A" = "A".</p>
Substitution	Replacement (simple)	Mixed Alphabet with Key Words	<p>Key: Unique letters of the key word in order, without repetitions Plain: A B C ... X Y Z Cipher: <Key> followed by remaining letters of the alphabet, without repetitions</p>
		Keyword Columnar Transposition Substitution	<ol style="list-style-type: none"> Row 1: Key word unique chars (# cols) Rows 2-n: Remaining unique chars in rows of a fixed column table Add a padding character as needed Cipher text is simply reading columns top down in alphabetical order
Transposition	Rearranged	Columnar Transposition	<ol style="list-style-type: none"> Agree upon number of columns Rows 1-n: Use clear text to write out rows of a fixed column table Add a padding character as needed Cipher text is simply reading columns top down in order left to right

Spreadsheet Example – Caesar Cipher

Function	Description	Excel Formula																																																												
<table border="1"> <thead> <tr> <th>Operation</th> <th></th> <th>A</th> <th>B</th> <th>C</th> <th>D</th> <th>E</th> <th>F</th> <th>G</th> <th>H</th> <th>I</th> <th>J</th> </tr> </thead> <tbody> <tr> <td>Plain Text</td> <td>1</td> <td>S</td> <td>K</td> <td>Y</td> <td>I</td> <td>S</td> <td>C</td> <td>L</td> <td>E</td> <td>A</td> <td>R</td> </tr> <tr> <td>Plain Text as #</td> <td>2</td> <td>18</td> <td>10</td> <td>24</td> <td>8</td> <td>18</td> <td>2</td> <td>11</td> <td>4</td> <td>0</td> <td>17</td> </tr> <tr> <td>Cipher Text as #</td> <td>3</td> <td>25</td> <td>27</td> <td>5</td> <td>15</td> <td>25</td> <td>9</td> <td>18</td> <td>11</td> <td>7</td> <td>24</td> </tr> <tr> <td>Cipher Text</td> <td>4</td> <td>Z</td> <td>R</td> <td>F</td> <td>P</td> <td>Z</td> <td>J</td> <td>S</td> <td>L</td> <td>H</td> <td>Y</td> </tr> </tbody> </table>			Operation		A	B	C	D	E	F	G	H	I	J	Plain Text	1	S	K	Y	I	S	C	L	E	A	R	Plain Text as #	2	18	10	24	8	18	2	11	4	0	17	Cipher Text as #	3	25	27	5	15	25	9	18	11	7	24	Cipher Text	4	Z	R	F	P	Z	J	S	L	H	Y
Operation		A	B	C	D	E	F	G	H	I	J																																																			
Plain Text	1	S	K	Y	I	S	C	L	E	A	R																																																			
Plain Text as #	2	18	10	24	8	18	2	11	4	0	17																																																			
Cipher Text as #	3	25	27	5	15	25	9	18	11	7	24																																																			
Cipher Text	4	Z	R	F	P	Z	J	S	L	H	Y																																																			
CODE("A")	Converts an ASCII character into a number	A2=CODE (A1) - CODE ("A")																																																												
MOD(n, m)	Adds a fixed offset to each number (n) then mods it by m	A3=MOD (A2 + 7, 26)																																																												
CHAR(65)	Converts a number into an ASCII character	A4=CHAR (A3 + CODE ("A"))																																																												
Combined	All three functions combined into one	A4=CHAR (MOD (CODE (A1) - CODE ("A") + 7, 26) + CODE ("A"))

RSA Algorithm

Term	Definition	
RSA	Public key cryptosystem developed by Rivest, Adelman, and Shamir in 1978.	
Key Prep	<ol style="list-style-type: none"> Bob selects two large prime numbers, p and q. Bob computes $N = pq$ and $\phi = (p-1)(q-1)$ Bob finds an integer e such that $\gcd(e, \phi) = 1$. Bob computes the multiplicative inverse of $e \pmod{\phi}$: an integer d such that $(ed \pmod{\phi}) = 1$. Public (encryption) key: N and e. Private (decryption) key: d. 	
Example	<ol style="list-style-type: none"> Bob selects two primes: $p = 31$ $q = 59$ Compute: $N = p \cdot q = 31 \cdot 59 = 1829$ $\phi = (p - 1) \cdot (q - 1) = 30 \cdot 58 = 1740$ Find integer e such that $\gcd(e, \phi) = 1$ Guess $e = 859$ and check: $\gcd(859, 1740) = 1$ If the first guess is not relatively prime to ϕ, try another. Using Euclid's algorithm, find A and B such that $A \cdot 859 + B \cdot 1740 = 1$ $79 \cdot 859 + (-39) \cdot 1740 = 1$ $79 \cdot 859 = 1 \pmod{1740}$ $d = 79$ is the inverse of $859 \pmod{1740}$ Public key: (e, N) $e = 859$ $N = 1829$ Private key: (d, N) $d = 79$ $N = 1829$ 	
Encryption	$c = m^e \pmod{N}$	Public key: 
Decryption	$m = c^d \pmod{N}$	Private key: 
Number Theory Fact	Let p and q be prime numbers and $pq = N$. Suppose that $m \in \mathbb{Z}_N$ and $\gcd(m, N) = 1$. Then $m^{(p-1)(q-1)} \pmod{N} = 1$.	
Theorem: Validity of the RSA Cryptosystem	If $m \in \mathbb{Z}_N$ and $\gcd(m, N) = 1$, then RSA encryption and decryption applied to m always yield m as the unique result.
