## Number Sets

| Symbo | Definition | Examples | Equations | Solution |
| :---: | :---: | :---: | :---: | :---: |
| $\emptyset$ | empty set, <br> set with no members | \{\} | $1=2$ | null |
| $\mathbb{N}$ | natural numbers | $\mathbb{N}_{1}=\{1,2,3, \ldots\}$ | Pre-2010 | NA |
|  |  | $\mathbb{N}_{0}=\{0,1,2,3, \ldots\}$ | See ISO 80000-2 2-6.1 |  |
| P | prime numbers | $\{2,3,5,7,11,13, \ldots\}$ | unofficial | NA |
| $\mathbb{Z}$ | integers | $\{\ldots,-2,-1,0,1,2, \ldots\}$ | $x+7=0$ | $x=-7$ |
| Q | rational numbers | $\{0,1 / 4,1 / 2,3 / 4,1\}$ | $4 x-1=0$ | $x=1 / 4$ |
| A | algebraic numbers | $\{5,-7,1 / 2, \sqrt{2}\}$ | $2 x^{2}+4 x-7=0$ | x is algebraic |
| $\mathbb{T}$ | transcendental numbers | $\left\{\pi, \mathrm{e}, \mathrm{e}^{\pi}, \sin (\mathrm{x}), \log _{\mathrm{b}} \mathrm{a}\right\}$ | $\mathbb{T}=\mathbb{U}-\mathbb{A}$ | NA |
| $\mathbb{R}$ | real numbers | $\{3.1415,-1,7 / 8, \sqrt{2}, \pi\}$ | $x^{2}-2=0$ | $x= \pm \sqrt{2}$ |
| II | imaginary numbers | $\{2 \mathrm{i}, \sqrt{-1}\}$ | $x^{2}+1=0$ | $\begin{gathered} x= \pm \sqrt{-1} \\ x= \pm i \\ \hline \end{gathered}$ |
| C | complex numbers | $\{1+2 i,-3.4 i, 5 / 8\}$ | $x^{2}-4 x+5=0$ | $x=2 \pm i$ |
| $\mathbb{U}$ | universal set | \{all possible values\} | $\infty$ | NA |
|  |  |  |  |  |

## Derived Number Sets

| Symbol | Definition | Equations | Examples |
| :---: | :---: | :---: | :---: |
| Integers $\mathbb{Z}$ |  |  |  |
| \{0\} | zero | $\mathrm{n}=0$ | \{0\} |
| $\begin{gathered} \mathbb{Z}^{*} \\ \mathbb{Z}-\{0\} \\ \mathbb{Z} \backslash\{0\} \end{gathered}$ | non-zero integers | $\mathrm{n} \neq 0$ | $\{-3,-2,-1,1,2,3, \ldots\}$ |
| $\mathbb{Z}^{+}$ | positive integers | $n>0$ | $\{1,2,3, \ldots\}$ |
| $\mathbb{N} \cup\{0\}$ | non-negative integers | $n \geq 0$ | $\{0,1,2,3, \ldots\}$ |
| $\mathbb{Z}^{-}$ | negative integers | $\mathrm{n}<0$ | $\{\ldots,-3,-2,-1\}$ |
| $\mathbb{Z}^{-} \cup\{0\}$ | non-positive integers | $\mathrm{n} \leq 0$ | $\{\ldots,-3,-2,-1,0\}$ |
| Real Numbers $\mathbb{R}$ |  |  |  |
| \{0\} | zero | $\mathrm{x}=0$ | \{0.0\} |
| $\begin{aligned} & \mathbb{R}-\{0\} \\ & \mathbb{R} \backslash\{0\} \\ & \hline \end{aligned}$ | non-zero real numbers | $x \neq 0$ | \{-0.001, 0.001\} |
| $\begin{gathered} \mathbb{R}^{+} \\ (0, \infty) \\ \hline \end{gathered}$ | positive real numbers | $x>0$ | $\{0.0001,0.0002, \ldots\}$ |
| $\begin{gathered} \mathbb{R}+\cup\{0\} \\ {[0, \infty)} \\ \hline \end{gathered}$ | non-negative real numbers | $x \geq 0$ | $\{0,0.0001,0.0002, \ldots\}$ |
| $\begin{gathered} \mathbb{R}^{-} \\ (-\infty, 0) \end{gathered}$ | negative real numbers | $\mathrm{x}<0$ | $\{\ldots,-0.0002,-0.0001\}$ |
| $\begin{gathered} \mathbb{R}-\cup\{0\} \\ (-\infty, 0] \\ \hline \end{gathered}$ | non-positive real numbers | $x \leq 0$ | $\{. . .,-0.0002,-0.0001,0\}$ |
| Natural, $\mathbb{N}$ |  | he counting nu | o may be included). |
|  |  Ex <br> -3 -2 | $\stackrel{\rightharpoonup}{0}$ | clude the negatives. |
| Rational, $\mathbb{Q}$ <br> Insert all the fractions. |  |  |  |
| Real Algebraic, $\mathbb{A}_{R}$ <br> Insert all the roots. <br>  |  |  |  |
| Real, $\mathbb{R}$ ( Fill in all the numbers to make a continuous line. |  |  |  |
| $\begin{array}{ccccccccc}-\pi & -e & -\sqrt{2} & -1 / 2 & 1 / 2 & \sqrt{ } 2 & e & e & \pi\end{array}$ |  |  |  |
|  | $\begin{array}{lll}-3 & -2 & -1\end{array}$ | 0 | 23 |

## Definitions

| Term | Definition |
| :---: | :---: |
| Definition | A precise and unambiguous description of the meaning of a mathematical term. It characterizes the meaning of a word by giving all the properties and only those properties that must be true. |
| Theorem | A mathematical statement that is proved using rigorous mathematical reasoning. In a mathematical paper, the term theorem is often reserved for the most important results. |
| Lemma | A minor result whose sole purpose is to help in proving a theorem. It is a steppingstone on the path to proving a theorem. Very occasionally lemmas can take on a life of their own (Zorn's lemma, Urysohn's lemma, Burnside's lemma, Sperner's lemma). |
| Corollary | A result in which the (usually short) proof relies heavily on a given theorem (we often say that "this is a corollary of Theorem A"). |
| Proposition | A proved and often interesting result, but generally less important than a theorem. |
| Conjecture | A statement that is unproved, but is believed to be true (Collatz conjecture, Goldbach conjecture, twin prime conjecture). |
| Claim | An assertion that is then proved. It is often used like an informal lemma. |
| Axiom / Postulate | A statement that is assumed to be true without proof. These are the basic building blocks from which all theorems are proved (Euclid's five postulates, ZermeloFraenkel axioms, Peano axioms). |
| Identity | A mathematical expression giving the equality of two (often variable) quantities (trigonometric identities, Euler's identity). |
| Paradox | A statement that can be shown, using a given set of axioms and definitions, to be both true and false. Paradoxes are often used to show the inconsistencies in a flawed theory (Russell's paradox). The term paradox is often used informally to describe a surprising or counterintuitive result that follows from a given set of rules (Banach-Tarski paradox, Alabama paradox, Gabriel's horn). |

[^0]
## Ch. 1.2: Natural Numbers $\mathbb{N}$

| Axiom / Theorem / Lemma / Definition | Description |
| :---: | :---: |
| Operations: Binary, Unary (Definition 1.1.1) | Let $S$ be a set. <br> A binary operation on $S$ is a function $S \times S \rightarrow S$. <br> A unary operation on $S$ is a function $S \rightarrow S$. |
| Peano Postulates (Axiom 1.2.1) | There exists a set $\mathbb{N}$ with an element $1 \in \mathbb{N}$ and a function $\mathrm{s}: \mathbb{N} \rightarrow$ $\mathbb{N}$ that satisfy the following three properties. <br> a. There is no $n \in \mathbb{N}$ such that $s(n)=1$. <br> b. The function $s$ is injective. <br> c. Let $\mathrm{G} \subseteq \mathbb{N}$ be a set. Suppose that $1 \in \mathrm{G}$, and that if $\mathrm{g} \in \mathrm{G}$ then $\mathrm{s}(\mathrm{g}) \in \mathrm{G}$. Then $\mathrm{G}=\mathbb{N}$. |
| Natural Number (Definition 1.2.2) | The set of natural numbers, denoted $\mathbb{N}$, is the set the existence of which is given in the Peano Postulates. |
| Lemma 1.2.3 | Let $a \in \mathbb{N}$. Suppose that $a \neq 1$. <br> Then there is a unique $b \in \mathbb{N}$ such that $a=s(b)$. |
| Definition by Recursion (Theorem 1.2.4) | Let H be a set, let $\mathrm{e} \in \mathrm{H}$ and let $\mathrm{k}: \mathrm{H} \rightarrow \mathrm{H}$ be a function. Then there is a unique function $f: \mathbb{N} \rightarrow H$ such that $f(1)=e$, and that $f \circ s=k \circ f$. |
| Operation: + <br> (Theorem 1.2.5) | There is a unique binary operation $+: \mathbb{N} \times \mathbb{N} \rightarrow \mathbb{N}$ that satisfies the following two properties for all $n, m \in \mathbb{N}$. <br> a. $n+1=s(n)$. <br> (successor). <br> b. $n+s(m)=s(n+m) .[=n+(m+1)]$ |
| Operation: * <br> (Theorem 1.2.6) | There is a unique binary operation ${ }^{*}: \mathbb{N} \times \mathbb{N} \rightarrow \mathbb{N}$ that satisfies the following two properties for all $n, m \in \mathbb{N}$. <br> a. $n * 1=n$. <br> b. $n * s(m)=n(m+1)=(n * m)+n$. |
| Addition Laws (Theorem 1.2.7a) | Let $\mathrm{a}, \mathrm{b}, \mathrm{c} \in \mathbb{N}$. <br> 1. If $a+c=b+c$, then $a=b$ <br> (Cancellation Law for Addition). <br> 2. $(a+b)+c=a+(b+c)$ <br> (Associative Law for Addition). <br> $3.1+a=s(a)=a+1$. <br> 4. $a+b=b+a$ <br> (Commutative Law for Addition). <br> 5. $a+b \neq 1$. <br> 6. $a+b \neq a$. |
| Multiplication Laws (Theorem 1.2.7b) | Let $\mathrm{a}, \mathrm{b}, \mathrm{c} \in \mathbb{N}$. <br> 7. $a * 1=a=1$ * $a$ <br> (Identity Law for Multiplication). <br> 8. $(a+b) c=a c+b c$ <br> (Distributive Law). <br> 9. $a b=b a$ <br> (Commutative Law for Multiplication). <br> 10. $c(a+b)=c a+c b$ <br> (Distributive Law). <br> 11. $(a b) c=a(b c) \quad$ (Associative Law for Multiplication). <br> 12. If $\mathrm{ac}=\mathrm{bc}$ then $\mathrm{a}=\mathrm{b}$ <br> (Cancellation Law for Multiplication). <br> 13. $a b=1$ if and only if $a=1=b$. |
| Relation: < <br> (Definition 1.2.8a) | The relation < on $\mathbb{N}$ is defined by $\mathrm{a}<\mathrm{b}$ if and only if there is some p $\in N$ such that $a+p=b$, for $a l l a, b \in N$. |
| Relation: $\leq$ <br> (Definition 1.2.8b) | The relation $\leq$ on $\mathbb{N}$ is defined by $\mathrm{a} \leq \mathrm{b}$ if and only if $\mathrm{a}<\mathrm{b}$ or $\mathrm{a}=\mathrm{b}$, for all $a, b \in \mathbb{N}$. |

| Relation: < and $\leq$ <br> (Theorem 1.2.9) | Let $\mathrm{a}, \mathrm{b}, \mathrm{c}, \mathrm{d} \in \mathbb{N}$. <br> 1. $\mathrm{a} \leq \mathrm{a}$, and $\mathrm{a}<\mathrm{a}$, and $\mathrm{a}<\mathrm{a}+1$. <br> 2. $1 \leq \mathrm{a}$. <br> 3. If $\mathrm{a}<\mathrm{b}$ and $\mathrm{b}<\mathrm{c}$, then $\mathrm{a}<\mathrm{c}$; if $\mathrm{a} \leq \mathrm{b}$ and $\mathrm{b}<\mathrm{c}$, then $\mathrm{a}<\mathrm{c}$; if $\mathrm{a}<\mathrm{b}$ and $b \leq c$, then $a<c$; if $a \leq b$ and $b \leq c$, then $a \leq c$. <br> 4. $a<b$ if and only if $a+c<b+c$. <br> 5. $a<b$ if and only if $a c<b c$. <br> 6. Precisely one of $\mathrm{a}<\mathrm{b}$ or $\mathrm{a}=\mathrm{b}$ or $\mathrm{a}>\mathrm{b}$ holds (Trichotomy Law). <br> 7. $a \leq b$ or $b \leq a$. <br> 8. If $a \leq b$ and $b \leq a$, then $a=b$. <br> 9. It cannot be that $b<a<b+1$. <br> 10. $a \leq b$ if and only if $a<b+1$. <br> 11. $a<b$ if and only if $a+1 \leq b$. |
| :---: | :---: |
| Well-Ordering Principle (Theorem 1.2.10) | Let $G \subseteq \mathbb{N}$ be a non-empty set. Then there is some $m \in G$ such that $\mathrm{m} \leq \mathrm{g}$ for all $\mathrm{g} \in \mathrm{G}$. |

## Ch. 1.3-1.4: Integers $\mathbb{Z}$

| Axiom, Theorem, etc. | Description |
| :---: | :---: |
| Relation: ~ <br> (Definition 1.3.1) | The relation $\sim$ on $\mathbb{N} \times \mathbb{N}$ is defined by (a,b) $\sim(\mathrm{c}, \mathrm{d})$ if and only if $\mathrm{a}+$ $d=b+c$, for all $(a, b),(c, d) \in \mathbb{N} \times \mathbb{N}$. |
| Relation: ~ <br> (Lemma 1.3.2) | The relation $\sim$ is an equivalence relation on $\mathbb{N} \times \mathbb{N}$. |
| Integers: $\mathbb{Z}$ <br> (Definition 1.3.3) | The set of integers, denoted $\mathbb{Z}$, is the set of equivalence classes of $\mathbb{N} \times \mathbb{N}$ with respect to the equivalence relation $\sim$. |
| Well-Defined: +, * (Lemma 1.3.4) | The binary operations + and *, the unary operation -, and the relation $<$, all on $\mathbb{Z}$, are well-defined. |
| Addition \& Multiplication Laws <br> (Definition 1.4.1 \& 1.3.5) | An ordered integral domain is a set $R$ with elements $0,1 \in R$, binary operations + and ', a unary operation - and a relation <, which satisfy the following properties. <br> Let $x, y, z \in R$. <br> a. $(x+y)+z=x+(y+z) \quad$ (Associative Law for Addition). <br> b. $x+y=y+x$ <br> (Commutative Law for Addition). <br> c. $x+0=x$ <br> (Identity Law for Addition). <br> d. $x+(-x)=0$ <br> (Inverses Law for Addition). <br> e. $(x y) z=x(y z)$ <br> (Associative Law for Multiplication). <br> f. $x y=y x$ <br> (Commutative Law for Multiplication). <br> g. $x \cdot 1=x$ <br> (Identity Law for Multiplication). <br> h. $x(y+z)=x y+x z$ <br> (Distributive Law). <br> i. If $x y=0$, then $x=0$ or $y=0$ (No Zero Divisors Law). <br> j. Precisely one of $\mathrm{x}<\mathrm{y}$ or $\mathrm{x}=\mathrm{y}$ or $\mathrm{x}>\mathrm{y}$ holds (Trichotomy Law). <br> k. If $x<y$ and $y<z$, then $x<z \quad$ (Transitive Law). <br> I. If $x<y$ then $x+z<y+z \quad$ (Addition Law for Order). <br> m. If $x<y$ and $z>0$, then $x z<y z$ (Multiplication Law for Order). <br> n. $0 \neq 1$ <br> (Non-Triviality). |
| Relation: $\leq$ (Definition 1.4.2) | Let $R$ be an ordered integral domain, and let $A \subseteq R$ be a set. <br> 1. The relation $\leq$ on $R$ is defined $b y \leq b$ if and only if $a<b$ or $a=b$, for all $a, b \in R$. <br> 2. The set $A$ has a least element if there is some $a \in A$ such that $a \leq$ $x$ for all $x \in A$. |
| Well-Ordering Principle (Definition 1.4.3) | Let R be an ordered integral domain. The ordered integral domain $R$ satisfies the Well-Ordering Principle if every non-empty subset of $\{x \in R \mid x>0\}$ has a least element. |
| Axiom for the Integers (Axiom 1.4.4) | There exists an ordered integral domain $\mathbb{Z}$ that satisfies the WellOrdering Principle. |

| Properties of Integers (Lemma 1.4.5 \& 1.3.8) | Let $\mathrm{x}, \mathrm{y}, \mathrm{z} \in \mathbb{Z}$. <br> 1. If $x+z=y+z$, then $x=y$ <br> (Cancellation Law for Addition). <br> 2. $-(-x)=x$. <br> 3. $-(x+y)=(-x)+(-y)$. <br> 4. $x \cdot 0=0$. <br> 5. If $z \neq 0$ and if $x z=y z$, then $x=y \quad$ (Cancellation Law for Mult.). <br> 6. $(-x) y=-x y=x(-y)$. <br> 7. $x y=1$ if and only if $x=1=y$ or $x=-1=y$. <br> 8. $x>0$ if and only if $-x<0$, and $x<0$ if and only if $-x>0$. <br> 9. $0<1$. <br> 10. If $x \leq y$ and $y \leq x$, then $x=y$. <br> 11. If $x>0$ and $y>0$, then $x y>0$. If $x>0$ and $y<0$, then $x y<0$. |
| :---: | :---: |
| Discreteness <br> (Theorem 1.4.6 \& 1.3.9) | Let $\mathrm{x} \in \mathbb{Z}$. Then there is no $\mathrm{y} \in \mathbb{Z}$ such that $\mathrm{x}<\mathrm{y}<\mathrm{x}+1$. |
| Positive/Negative: +, - <br> (Definition 1.4.7 \& 1.3.6) | 1. Let $x \in \mathbb{Z}$. The number $x$ is positive if $x>0$, and the number $x$ is negative if $\mathrm{x}<0$. |
| $\mathbb{N} \subseteq \mathbb{Z}:$ <br> (Theorem 1.3.7 \& Definition 1.4.7) | Let $\mathrm{i}: \mathbb{N} \rightarrow \mathbb{Z}$ be defined by $\mathrm{i}(\mathrm{n})=[(\mathrm{n}+1,1)]$ for all $\mathrm{n} \in \mathbb{N}$. <br> 1. The function i: $\mathbb{N} \rightarrow \mathbb{Z}$ is injective. <br> 2. $i(\mathbb{N})=\left\{x \in \mathbb{Z} \mid x>0^{\wedge}\right\}$. <br> 3. $i(1)=1^{\wedge}$. <br> 4. Let $\mathrm{a}, \mathrm{b} \in \mathbb{N}$. Then <br> a. $i(a+b)=i(a)+i(b) ;$ <br> b. $i(a b)=i(a) i(b)$; <br> c. $a<b$ if and only if $i(a)<i(b)$. |
| Natural Numbers: $\mathbb{N}$ (Definition 1.4.7) | 2. The set of natural numbers, denoted $\mathbb{N}$, is defined by $\mathbb{N}=\{x \in \mathbb{Z}$ $\mid x>0\}$. |
| Peano Postulates <br> (Theorem 1.4.8 \& Axiom <br> 1.2.1) | Let $\mathrm{s}: \mathbb{N} \rightarrow \mathbb{N}$ be defined by $\mathrm{s}(\mathrm{n})=\mathrm{n}+1$ for all $\mathrm{n} \in \mathbb{N}$. <br> a. There is no $n \in \mathbb{N}$ such that $s(n)=1$. <br> b. The function $s$ is injective. <br> c. Let $G \subseteq \mathbb{N}$ be a set. Suppose that $1 \in G$, and that if $g \in G$ then $\mathrm{s}(\mathrm{g}) \in \mathrm{G}$. Then $\mathrm{G}=\mathbb{N}$. |

| Definition / Lemma / Theorem | Description |
| :---: | :---: |
| Relation: $\simeq, \mathbb{Z} *$ <br> (Definition 1.5.1) | Let $\mathbb{Z} *=\mathbb{Z}-\{0\}$. The relation $=$ on $\mathbb{Z} \times \mathbb{Z} *$ is defined by $(x, y)=(z, w)$ if and only if $x w=y z$, for all $(x, y),(z, w) \in \mathbb{Z} \times \mathbb{Z}$. |
| Relation: $=$ <br> (Lemma 1.5.2) | The relation $=$ is an equivalence relation. |
| Rational Numbers: $\mathbb{Q}$ <br> (Definition 1.5.3) | The set of rational numbers, denoted $\mathbb{Q}$, is the set of equivalence classes of $\mathbb{Z} \times \mathbb{Z} *$ with respect to the equivalence relation $=$. <br> The elements $0^{-}, 1^{-} \in \mathbb{Q}$ are defined by $0^{-}=[(0,1)]$ and $1^{-}=[(1,1)]$. Let $\mathbb{Q} *=\mathbb{Q}-\left\{0^{-}\right\}$. The binary operations + and $\cdot$ on $\mathbb{Q}$ are defined by $\begin{aligned} & {[(x, y)]+[(z, w)]=[(x w+y z, y w)]} \\ & {[(x, y)] \cdot[(z, w)]=[(x z, y w)]} \end{aligned}$ <br> for all $[(x, y)],[(z, w)] \in \mathbb{Q}$. <br> - -: The unary operation - on $\mathbb{Q}$ is defined by $-[(x, y)]=[(-x, y)]$ for all $[(x, y)] \in \mathbb{Q}$. <br> - ${ }^{-1}$ : The unary operation ${ }^{-1}$ on $\mathbb{Q} *$ is defined by $[(x, y)]^{-1}=[(y, x)]$ for all $[(x, y)] \in \mathbb{Q} *$. <br> - <: The relation <on $\mathbb{Q}$ is defined by $[(x, y)]<[(z, w)]$ if and only if either $\mathrm{xw}<\mathrm{yz}$ when $\mathrm{y}>0$ and $\mathrm{w}>0$ or when $\mathrm{y}<0$ and $\mathrm{w}<0$, <br> - $>$ : The relation $>$ on $\mathbb{Q}$ is defined by $[(x, y)]>[(z, w)]$ if and only if either $\mathrm{xw}>\mathrm{yz}$ when $\mathrm{y}>0$ and $\mathrm{w}<0$ or when $\mathrm{y}<0$ and $\mathrm{w}>0$, for all $[(\mathrm{x}, \mathrm{y})],[(\mathrm{z}, \mathrm{w})] \in \mathbb{Q}$. <br> - $\leq$ : The relation $\leq$ on $\mathbb{Q}$ is defined by $[(x, y)] \leq[(z, w)]$ if and only if $[(x, y)]<[(z, w)]$ or $[(x, y)]=[(z, w)]$, for all $[(x, y)],[(z, w)] \in \mathbb{Q}$. |
| Well-Defined: $\mathbb{Q}$ (Lemma 1.5.4) | The binary operations + and $\cdot$, the unary operations - and ${ }^{-1}$, and the relation <, all on $\mathbb{Q}$, are well-defined. |

| Addition and <br> Multiplication Laws <br> (Theorem 1.5.5) | Let $r, s, t \in \mathbb{Q}$. <br> Field: <br> 1. $(r+s)+t=r+(s+t)$ <br> (Associative Law for Addition). <br> 2. $r+s=s+r$ (Commutative Law for Addition). <br> 3. $r+0^{-}=r$ (Identity Law for Addition). <br> 4. $r+(-r)=0^{-}$ <br> (Inverses Law for Addition). <br> 5. $(\mathrm{rs}) \mathrm{t}=\mathrm{r}(\mathrm{st})$ <br> (Associative Law for Multiplication). <br> 6. $\mathrm{rs}=\mathrm{sr}$ (Commutative Law for Multiplication). <br> 7. $r \cdot 1^{-}=r$ <br> (Identity Law for Multiplication). <br> 8. If $r \neq 0^{-}$, then $r \cdot r^{-1}=1^{-}$ <br> (Inverses Law for Multiplication). <br> 9. $r(s+t)=r s+r t$ <br> (Distributive Law). <br> Ordered Field: <br> 11. If $r<s$ and $s<t$, then $r<t \quad$ (Transitive Law). <br> 12. If $r<s$ then $r+t<s+t \quad$ (Addition Law for Order). <br> 13. If $r<s$ and $t>0^{-}$, then $r t<s t$ (Multiplication Law for Order). <br> 14. $0^{-} \neq 1^{-}$ (Non-Triviality). |
| :---: | :---: |
| $\mathbb{Z} \subseteq \mathbb{Q}:$ <br> (Theorem 1.5.6) | Let $\mathrm{i}: \mathbb{Z} \rightarrow \mathbb{Q}$ be defined by $\mathrm{i}(\mathrm{x})=[(\mathrm{x}, 1)]$ for all $\mathrm{x} \in \mathbb{Z}$. <br> 1. The function i: $\mathbb{Z} \rightarrow \mathbb{Q}$ is injective. <br> 2. $\mathrm{i}(0)=0^{-}$and $\mathrm{i}(1)=1^{-}$. <br> 3. Let $x, y \in \mathbb{Z}$. Then <br> a. $i(x+y)=i(x)+i(y) ;$ <br> b. $i(-x)=-i(x)$; <br> c. $i(x y)=i(x) i(y)$; <br> d. $x<y$ if and only if $i(x)<i(y)$. <br> 4. For each $r \in \mathbb{Q}$ there are $x, y \in \mathbb{Z}$ such that $y \neq 0$ and $r=i(x)(i(y))^{-1}$. |
| Operations: $-, \div, \mathrm{s}^{-1}, \frac{r}{s}$ <br> (Definition 1.5.7) | The binary operation - on $\mathbb{Q}$ is defined by $r-s=r+(-s)$ for all $r, s \in \mathbb{Q}$. <br> The binary operation $\div$ on $\mathbb{Q} *$ is defined by $r \div s=r s^{-1}$ for all $r, s \in \mathbb{Q} *$; we also let $0 \div s=0 \cdot s^{-1}=0$ for all $s \in \mathbb{Q} *$. <br> The number $\mathrm{r} \div \mathrm{s}$ is also denoted $\frac{r}{s}$. |
| Rational Numbers: <br> (Lemma 1.5.8) <br> (Definition 1.5.3 <br> Restated) | Let $\mathrm{a}, \mathrm{c} \in \mathbb{Z}$ and $\mathrm{b}, \mathrm{d} \in \mathbb{Z} *$. <br> 1. $\frac{a}{b}=\frac{c}{d}$ if and only if ad $=b c$. <br> 2. $\frac{a}{b}+\frac{c}{d}=\frac{a d+b c}{b d}$. <br> 3. $-\frac{a}{b}=\frac{-a}{b}$. <br> 4. $\frac{a}{b} \cdot \frac{c}{d}=\frac{a c}{b d}$. <br> 5. If $\mathrm{a} \neq 0$, then $\left(\frac{a}{b}\right)^{-1}=\frac{b}{a}$. <br> 6. If $\mathrm{b}>0$ and $\mathrm{d}>0$, or if $\mathrm{b}<0$ and $\mathrm{d}<0$, then $\frac{a}{b}<\frac{c}{d}$ if and only if $\mathrm{ad}<\mathrm{bc}$; if $\mathrm{b}>0$ and $\mathrm{d}<0$, or if $\mathrm{b}<0$ and $\mathrm{d}>0$, then $\frac{a}{b}>\frac{c}{d}$ if and only if $a d>b c$. |

## Ch. 1.6: Dedekind Cuts $\mathrm{Dr}_{\mathrm{r}}$

| Definition / Lemma | Description |
| :---: | :---: |
| Dedekind cut <br> (Definition 1.6.1) <br> AKA "upper cut" | Let $A \subseteq \mathbb{Q}$ be a set. The set $A$ is a Dedekind cut if the following three properties hold. <br> a. $A \neq 0$ and $A \neq \mathbb{Q}$. <br> b. Let $x \in A$. If $y \in \mathbb{Q}$ and $y \geq x$, then $y \in A$. <br> c. Let $x \in A$. Then there is some $y \in A$ such that $y<x$. |
| Interpreting Dedekind cuts | A Dedekind cut is a set, $A$, of rational numbers, with the properties shown above. <br> a. Property (a) says A must be nonempty and cannot be all of Q. <br> b. Property (b) says if a number, $x$, is in $A$, then all rational numbers greater than $x$ are also in $A$. <br> c. Property (c) is where things get interesting. It says that if $x$ is in $A$, then there is at least one element of $A$ that is smaller than $x$. (Actually, there are infinitely many.) This property is what is going to allow us to fill in the gaps in the rational numbers. |
| Dedekind cut Existence (Lemma 1.6.2) | Let $\mathrm{r} \in \mathbb{Q}$. Then the set $\{x \in \mathbb{Q} \mid \mathrm{x}>\mathrm{r}\}$ is a Dedekind cut. |
| Dedekind cut not in form of Lemma 1.6.2 <br> (Example 1.6.3) | Let $\begin{equation*} T=\left\{x \in \mathbb{Q} \mid x>0 \text { and } x^{2}>2\right\} . \tag{1.6.1} \end{equation*}$ <br> It is seen by Exercise 1.6.2 (1) that $T$ is a Dedekind cut, and by Part (2) of that exercise it is seen that if $T$ has the form $\{x \in \mathbb{Q} \mid x>r\}$ for some $r \in \mathbb{Q}$, then $r^{2}=2$. By Theorem 2.6.11 we know that there is no rational number $x$ such that $x^{2}=2$, and it follows that $T$ is a Dedekind cut that is not of the form given in Lemma 1.6.2. |
| Rational cut $\mathrm{Dr}_{\mathrm{r}}$ <br> (Definition 1.6.4) | Let $r \in \mathbb{Q}$. <br> The rational cut at $r$, denoted $D_{r}$, is the Dedekind cut $D_{r}=\{x \in \mathbb{Q}$ $\mid x>r\}$. <br> An irrational cut is a Dedekind cut that is not a rational cut at any rational number. |
| Complement of Dedekind cut <br> (Lemma 1.6.5) | Let $\mathrm{A} \subseteq \mathbb{Q}$ be a Dedekind cut. <br> 1. $\mathbb{Q}-A=\{x \in \mathbb{Q} \mid x<a$ for all $a \in A\}$. $\quad$ or $\{x \in \mathbb{Q} \mid x \leq r\}$. <br> 2. Let $x \in \mathbb{Q}-A$. If $y \in \mathbb{Q}$ and $y \leq x$, then $y \in \mathbb{Q}-A$. |
| Trichotomy Law (Lemma 1.6.6) | Let $\mathrm{A}, \mathrm{B} \subseteq \mathbb{Q}$ be Dedekind cuts. Then precisely one of $\mathrm{A} \varsubsetneqq \mathrm{B}$ or $\mathrm{A}=\mathrm{B}$ or $\mathrm{B} \varsubsetneqq \mathrm{A}$ holds. <br> NOTE: $A \subsetneq B$ means that both $A \subset B$ and $A \neq B$. |

| Union of Family of Sets (Lemma 1.6.7) | Let $A$ be a non-empty family of subsets of $\mathbb{Q}$. Suppose that $X$ is a Dedekind cut for all $X \in A$. If $U_{X \in A} X \neq \mathbb{Q}$, then $U_{X \in A} X$ is a Dedekind cut. <br> For example, think about what happens if the set A is defined this way: $\begin{aligned} A= & \{x \in \mathbb{Q} \mid x>4\}, \\ & \{x \in \mathbb{Q} \mid x>3.2\}, \\ & \{x \in \mathbb{Q} \mid x>3.15\}, \\ & \{x \in \mathbb{Q} \mid x>3.142\}, \\ & \{x \in \mathbb{Q} \mid x>3.1416\}, \\ & \{x \in \mathbb{Q} \mid x>3.14160\}, \\ & \{x \in \mathbb{Q} \mid x>3.141593\}, \ldots\} \end{aligned}$ <br> If you were to union all of the elements of $A$, you would end up with $\{x \in \mathbb{Q} \mid x>\pi\}$. This is how the "gaps" get filled in. |
| :---: | :---: |
| Dedekind cut Examples (Lemma 1.6.8) | Let $A, B \subseteq \mathbb{Q}$ be Dedekind cuts. <br> 1. The set $\{r \in \mathbb{Q} \mid r=a+b$ for some $a \in A$ and $b \in B\}$ is a Dedekind cut. <br> 2. The set $\{r \in \mathbb{Q} \mid-r<c$ for some $c \in \mathbb{Q}-A\}$ is a Dedekind cut. 3. Suppose that $0 \in \mathbb{Q}-A$ and $0 \in \mathbb{Q}-B$. The set $\{r \in \mathbb{Q} \mid r=a b$ for some $a \in A$ and $b \in B\}$ is a Dedekind cut. <br> 4. Suppose that there is some $q \in \mathbb{Q}-A$ such that $q>0$. The set $\{r$ $\in \mathbb{Q} \mid \mathrm{r}>0$ and $\frac{1}{r}<\mathrm{c}$ for some $\left.\mathrm{c} \in \mathbb{Q}-\mathrm{A}\right\}$ is a Dedekind cut. |
| Well-Ordering Principle (Lemma 1.6.9) | Let $\mathrm{A} \subseteq \mathbb{Q}$ be a Dedekind cut. Let $\mathrm{y} \in \mathbb{Q}$. <br> 1. Suppose that $\mathrm{y}>0$. Then there are $u \in A$ and $v \in \mathbb{Q}-A$ such that $y=u-v$, and $v<e$ for some $e \in \mathbb{Q}-A$. <br> 2. Suppose that $\mathrm{y}>1$, and that there is some $\mathrm{q} \in \mathbb{Q}-\mathrm{A}$ such that q $>0$. Then there are $r \in A$ and $s \in \mathbb{Q}-\mathrm{A}$ such that $\mathrm{s}>0$, and $\mathrm{y}>\frac{r}{s}$, and $\mathrm{s}<\mathrm{g}$ for some $\mathrm{g} \in \mathbb{Q}$ - A . |

## Ch. 1.7: Real Numbers $\mathbb{R}$ (Ch. 1)

## Axiom / Theorem / <br> Lemma / Definition

## Description

| Real Numbers: $\mathbb{R}$ Definition 1.7.1 | The set of real numbers, denoted $\mathbb{R}$, is defined by $\mathbb{R}=\{A \subseteq \mathbb{Q} \mid A$ is a Dedekind cut $\}$. |
| :---: | :---: |
| Relations: < $\leq$ <br> (Definition 1.7.2) | The relation < on $\mathbb{R}$ is defined by <br> $A<B$ if and only if $A \supsetneqq B$, for all $A, B \in \mathbb{R}$. The relation $\leq$ on $\mathbb{R}$ is defined by $A \leq B$ if and only if $A \supseteq B$, for all $A, B \in \mathbb{R}$. |
| Operation: +, (Definition 1.7.3) | The binary operation + on $\mathbb{R}$ is defined by <br> $A+B=\{r \in \mathbb{Q} \mid r=a+b$ for some $a \in A$ and $b \in B\}$ for all $A, B \in \mathbb{R}$. <br> The unary operation - on $\mathbb{R}$ is defined by <br> $-A=\{r \in \mathbb{Q} \mid-r<c$ for some $c \in \mathbb{Q}-A\}$ for all $A \in \mathbb{R}$. |
| Multiply Operator Setup Lemma 1.7.4 | Let $A \in \mathbb{R}$, and let $r \in \mathbb{Q}$. <br> 1. $A>D_{r}$ if and only if there is some $q \in \mathbb{Q}-A$ such that $q>r$. <br> 2. $A \geq D_{r}$ if and only if $r \in \mathbb{Q}$ - A if and only if $a>r$ for all $a \in A$. <br> 3. If $A<D_{0}$ then $-A \geq D_{0}$. |
| Operations: •, $\boldsymbol{1}^{-1}$ <br> (Definition 1.7.5) | The binary operation $\bullet$ on $\mathbb{R}$ is defined by $\mathrm{A} \bullet \mathrm{~B}=\left\{\begin{array}{c} \{\mathrm{r} \in \mathbb{Q} \mid \mathrm{r}=\mathrm{ab} \text { for some } \mathrm{a} \in \mathrm{~A} \text { and } \mathrm{b} \in \mathrm{~B}\}, \\ \text { if } \mathrm{A} \geq D_{0} \text { and } \mathrm{B} \geq D_{0} \\ -[(-\mathrm{A}) \bullet \mathrm{B}], \quad \text { if } \mathrm{A}<D_{0} \text { and } \mathrm{B} \geq D_{0} \\ -[\mathrm{A} \cdot(-\mathrm{B})], \quad \text { if } \mathrm{A} \geq D_{0} \text { and } \mathrm{B}<D_{0} \\ (-\mathrm{A}) \bullet(-\mathrm{B}), \quad \text { if } \mathrm{A}<D_{0} \text { and } \mathrm{B}<D_{0} . \end{array}\right.$ <br> The unary operation ${ }^{-1}$ on $\mathbb{R}-\left\{D_{0}\right\}$ is defined by $\mathrm{A}^{-1}=\left\{\begin{array}{c} \left\{\mathrm{r} \in \mathbb{Q} \mid \mathrm{r}>0 \text { and } \frac{1}{r}<\mathrm{c} \text { for some } \mathrm{c} \in \mathbb{Q}-\mathrm{A}\right\}, \\ \text { if } \mathrm{A}>D_{0} \\ -(-\mathrm{A})^{-1}, \quad \text { if } \mathrm{A}<D_{0} . \end{array}\right.$ |

| Addition and Multiplication Laws (Theorem 1.7.6) | Let $A, B, C \in \mathbb{R}$. <br> Field: <br> 1. $(A+B)+C=A+(B+C)$ <br> (Associative Law for Addition). <br> 2. $A+B=B+A$ (Commutative Law for Addition). <br> 3. $A+D_{0}=A$ (Identity Law for Addition). <br> 4. $A+(-A)=D_{0}=0$ <br> (Inverses Law for Addition). <br> 5. $(A B) C=A(B C)$ <br> (Associative Law for Multiplication). <br> 6. $A B=B A$ (Commutative Law for Multiplication). <br> 7. $A \cdot D_{1}=A$ (Identity Law for Multiplication). <br> 8. If $A \neq D_{0}$, then $A A^{-1}=D_{1}=1$ <br> (Inverses Law for Multiplication). <br> 9. $A(B+C)=A B+A C$ <br> (Distributive Law). <br> Ordered Field: <br> 10. Precisely one of $\mathrm{A}<\mathrm{B}$ or $\mathrm{A}=\mathrm{B}$ or $\mathrm{A}>\mathrm{B}$ holds (Trichotomy Law). <br> 11. If $A<B$ and $B<C$, then $A<C$ <br> (Transitive Law). <br> 12. If $\mathrm{A}<\mathrm{B}$ then $\mathrm{A}+\mathrm{C}<\mathrm{B}+\mathrm{C}$ (Addition Law for Order). <br> 13. If $A<B$ and $C>D_{0}$, then $A C<B C \quad$ (Multiplication Law for Order). <br> 14. $\mathrm{D}_{0}<\mathrm{D}_{1}$ or $0<1$ <br> (Non-Triviality). |
| :---: | :---: |
| Least Upper Bound Property Setup (Definition 1.7.7) | Let $A \subseteq \mathbb{R}$ be a set. <br> 1. The set $A$ is bounded above if there is some $M \in \mathbb{R}$ such that $X \leq M$ for all $X \in A$. The number $M$ is called an upper bound of $A$. <br> 2. The set $A$ is bounded below if there is some $P \in \mathbb{R}$ such that $X \geq P$ for all $X \in A$. The number $P$ is called a lower bound of $A$. <br> 3. The set $A$ is bounded if it is bounded above and bounded below. <br> 4. Let $M \in \mathbb{R}$. The number $M$ is a least upper bound (also called a supremum) of $A$ if $M$ is an upper bound of $A$, and if $M \leq T$ for all upper bounds $T$ of $A$. <br> 5. Let $P \in \mathbb{R}$. The number $P$ is a greatest lower bound (also called an infimum) of $A$ if $P$ is a lower bound of $A$, and if $P \geq V$ for all lower bounds $V$ of $A$. |
| Greatest Lower Bound Property (glb) <br> (Theorem 1.7.8) | Let $\mathrm{A} \subseteq \mathbb{R}$ be a set. If A is non-empty and bounded below, then A has a greatest lower bound. (used in Dedekind cut proofs) |
| Least Upper Bound <br> Property (lub) <br> (Theorem 1.7.9) | Let $\mathrm{A} \subseteq \mathbb{R}$ be a set. If A is nonempty and bounded above, then A has a least upper bound. |
| $\begin{aligned} & \mathbb{Q} \subseteq \mathbb{R}: \\ & \text { (Theorem 1.7.10) } \end{aligned}$ | Let $\mathrm{i}: \mathbb{Q} \rightarrow \mathbb{R}$ be defined by $\mathrm{i}(r)=D_{r}$ for all $r \in \mathbb{R}$. <br> 1. The function i: $\mathbb{Q} \rightarrow \mathbb{R}$ is injective. <br> 2. $i(0)=D_{0}$ and $i(1)=D_{1}$. <br> 3. Let $r, s \in \mathbb{Q}$. Then <br> a. $i(r+s)=i(r)+i(s) ;$ <br> b. $i(-r)=-i(r)$; <br> c. $i(r s)=i(r) i(s)$; <br> d. if $r \neq 0$ then $i\left(r^{-1}\right)=[i(r)]^{-1}$; <br> e. $r<s$ if and only if $i(r)<i(s)$. |

## Ch. 2.2: Real Numbers $\mathbb{R}$

| Definitions / Axiom | Description |
| :---: | :---: |
| Addition and <br> Multiplication Laws <br> (Definition 2.2.1) | An ordered field is a set $F$ with elements $0,1 \in F$, binary operations + and $\cdot$, a unary operation - , a relation <, and a unary operation ${ }^{-1}$ on $\mathrm{F}-\{0\}$, which satisfy the following properties. <br> Let $x, y, z \in F$. <br> a. $(x+y)+z=x+(y+z)$ <br> (Associative Law for Addition). <br> b. $x+y=y+x$ <br> (Commutative Law for Addition). <br> c. $x+0=x$ <br> (Identity Law for Addition). <br> d. $x+(-x)=0$ <br> (Inverses Law for Addition). <br> e. $(x y) z=x(y z)$ <br> (Associative Law for Multiplication). <br> f. $x y=y x$ <br> (Commutative Law for Multiplication). <br> g. $x \cdot 1=x$ <br> (Identity Law for Multiplication). <br> h. If $x \neq 0$, then $x^{-1}=1$ <br> (Inverses Law for Multiplication). <br> i. $x(y+z)=x y+x z$ <br> k. If $x<y$ and $y<z$, then $x<z$ (Transitive Law). <br> l. If $x<y$ then $x+z<y+z \quad$ (Addition Law for Order). <br> m. If $x<y$ and $z>0$, then $x z<y z$ <br> (Multiplication Law for Order). <br> n. $0 \neq 1$ <br> (Non-Triviality). |
| Bounds <br> (Definition 2.2.2) | Let $F$ be an ordered field and let $A \subseteq F$ be a set. <br> 1 . The set $A$ is bounded above if there is some $M \in F$ such that $x \leq M$ for all $x \in A$. The number $M$ is called an upper bound of $A$. <br> 2. The set $A$ is bounded below if there is some $P \in F$ such that $x \geq P$ for all $x \in A$. The number $P$ is called a lower bound of $A$. <br> 3. The set $A$ is bounded if it is bounded above and bounded below. <br> 4. Let $M \in F$. The number $M$ is a least upper bound (also called a supremum) of $A$ if $M$ is an upper bound of $A$, and if $M \leq T$ for all upper bounds $T$ of $A$. <br> 5. Let $P \in F$. The number $P$ is a greatest lower bound (also called an infimum) of $A$ if $P$ is a lower bound of $A$, and if $P \geq V$ for all lower bounds V of A . |
| Least Upper Bound Property (Definition 2.2.3) | Let F be an ordered field. The ordered field F satisfies the Least Upper Bound Property if every non-empty subset of $F$ that is bounded above has a least upper bound. |
| Axiom for the Real Numbers <br> (Axiom 2.2.4) | There exists an ordered field $\mathbb{R}$ that satisfies the Least Upper Bound Property. |

## Ch. 2.3: Algebraic Properties of Real Numbers $\mathbb{R}$

| Definitions / Axiom | Description |
| :---: | :---: |
| ```Operators: -, \div, 2, , , , 2 (Definition 2.3.1)``` | 1a. The binary operation - on $\mathbb{R}$ is defined by $a-b=a+(-b)$ for $a l l a, b \in$ $\mathbb{R}$. <br> 1 b. The binary operation $\div$ on $\mathbb{R}-\{0\}$ is defined $b y a \div b=a b^{-1}$ for all $a, b$ $\in \mathbb{R}-\{0\}$; we also let $0 \div s=0 \cdot s^{-1}=0$ for all $s \in \mathbb{R}-\{0\}$. The number $a \div b$ is also denoted $\frac{a}{b}$ or $\mathrm{a} / \mathrm{b}$. <br> 2. Let $a \in \mathbb{R}$. The square of $a$, denoted $a^{2}$, is defined by $a^{2}=a \cdot a$. <br> 3. The relation $\leq$ on $\mathbb{R}$ is defined by $x \leq y$ if and only if $x<y$ or $x=y$, for all $x, y \in \mathbb{R}$. <br> 4. The number $2 \in \mathbb{R}$ is defined by $2=1+1$. |
| Properties of Real <br> Numbers <br> (Lemma 2.3.2) | Let $\mathrm{a}, \mathrm{b}, \mathrm{c} \in \mathbb{R}$. <br> 1. If $a+c=b+c$ then $a=b$ <br> (Cancellation Law for Addition). <br> 2. If $a+b=a$ then $b=0$. <br> 3. If $a+b=0$ then $b=-a$. <br> 4. $-(a+b)=(-a)+(-b)$. <br> 5. $-0=0$. <br> 6. If $\mathrm{ac}=\mathrm{bc}$ and $\mathrm{c} \neq 0$, then $\mathrm{a}=\mathrm{b}$ <br> (Cancellation Law for Multiplication). <br> 7. $0 \cdot a=0=a \cdot 0$. <br> 8. If $\mathrm{ab}=\mathrm{a}$ and $\mathrm{a} \neq 0$, then $\mathrm{b}=1$. <br> 9. If $a b=1$ then $b=a^{-1}$. <br> 10. If $a \neq 0$ and $b \neq 0$, then $(a b)^{-1}=a^{-1} b^{-1}$. <br> 11. $(-1) \cdot a=-a$. <br> 12. $(-a) b=-a b=a(-b)$. <br> 13. $-(-a)=a$. <br> 14. $(-1)^{2}=1$ and $1^{-1}=1$. <br> 15. If $a b=0$, then $a=0$ or $b=0$ <br> (No Zero Divisors Law). <br> 16. If $a \neq 0$ then $\left(a^{-1}\right)^{-1}=a$. <br> 17. If $a \neq 0$ then $(-a)^{-1}=-a^{-1}$. |

| Relations: <, $\leq$ <br> (Lemma 2.3.3) | Let $\mathrm{a}, \mathrm{b}, \mathrm{c}, \mathrm{d} \in \mathbb{R}$. <br> 1. If $a \leq b$ and $b \leq a$, then $a=b$. <br> 2. If $a \leq b$ and $b \leq c$, then $a \leq c$. <br> If $a \leq b$ and $b<c$, then $a<c$. <br> If $a<b$ and $b \leq c$, then $a<c$. <br> 3. If $a \leq b$ then $a+c \leq b+c$. <br> 4. If $a<b$ and $c<d$, then $a+c<b+d$; <br> if $a \leq b$ and $c \leq d$, then $a+c \leq b+d$. <br> 5. $a>0$ if and only if $-a<0$, and $a<0$ if and only if $-a>0$; also <br> $a \geq 0$ if and only if $-a \leq 0$, and $a \leq 0$ if and only if $-a \geq 0$. <br> 6. $a<b$ if and only if $b-a>0$ if and only if $-b<-a$; also <br> $a \leq b$ if and only if $b-a \geq 0$ if and only if $-b \leq-a$. <br> 7. If $a \neq 0$ then $a^{2}>0$. <br> 8. $-1<0<1$. <br> 9. $a<a+1$. <br> 10. If $\mathrm{a} \leq \mathrm{b}$ and $\mathrm{c}>0$, then $\mathrm{ac} \leq \mathrm{bc}$. <br> 11. If $0 \leq a<b$ and $0 \leq c<d$, then $a c<b d$; if $0 \leq a \leq b$ and $0 \leq c \leq d$, then $a c \leq b d$. <br> 12. If $a<b$ and $c<0$, then $a c>b c$. <br> 13. If $a>0$ then $a^{-1}>0$. <br> 14. If $a>0$ and $b>0$, then $a<b$ if and only if $b^{-1}<a^{-1}$ if and only if $a^{2}<b^{2}$. |
| :---: | :---: |
| Positive / Negative (Definition 2.3.4) | Let $a \in \mathbb{R}$. <br> The number a is positive if $a>0$; the number a is negative if a $<0$; and the number $a$ is non-negative if $a \geq 0$. |
| Positive / Negative (Lemma 2.3.5) | ```Let \(\mathrm{a}, \mathrm{b}, \mathrm{c}, \mathrm{d} \in \mathbb{R}\). 1. If \(a>0\) and \(b>0\), then \(a+b>0\). (Addition) If \(a>0\) and \(b \geq 0\), then \(a+b>0\). If \(a \geq 0\) and \(b \geq 0\), then \(a+b \geq 0\). 2. If \(a<0\) and \(b<0\), then \(a+b<0\). If \(a<0\) and \(b \leq 0\), then \(a+b<0\). If \(\mathrm{a} \leq 0\) and \(\mathrm{b} \leq 0\), then \(\mathrm{a}+\mathrm{b} \leq 0\). 3. If \(a>0\) and \(b>0\), then \(a b>0\). (Multiplication) If \(a>0\) and \(b \geq 0\), then \(a b \geq 0\). If \(a \geq 0\) and \(b \geq 0\), then \(a b \geq 0\). 4. If \(a<0\) and \(b<0\), then \(a b>0\). If \(a<0\) and \(b \leq 0\), then \(a b \geq 0\). If \(a \leq 0\) and \(b \leq 0\), then \(a b \geq 0\). 5. If \(a<0\) and \(b>0\), then \(a b<0\). If \(a<0\) and \(b \geq 0\), then \(a b \leq 0\). If \(a \leq 0\) and \(b>0\), then \(a b \leq 0\). If \(a \leq 0\) and \(b \geq 0\), then \(a b \leq 0\).``` |

| Intervals <br> (Definition 2.3.6) | Let $\mathrm{a}, \mathrm{b} \in \mathbb{R}$. <br> An open bounded interval is a set of the form $(a, b)=\{x \in \mathbb{R} \mid a<x<b\} \text {, where } a \leq b .$ <br> A closed bounded interval is a set of the form $[a, b]=\{x \in \mathbb{R} \mid a \leq x \leq b\}, \text { where } a \leq b .$ <br> A half-open interval is a set of the form $[a, b)=\{x \in \mathbb{R} \mid a \leq x<b\} \text { or }(a, b]=\{x \in \mathbb{R} \mid a<x \leq b\} \text {, where } a \leq b \text {. }$ <br> An open unbounded interval is a set of the form $(a, \infty)=\{x \in \mathbb{R} \mid a<x\} \text { or }(-\infty, b)=\{x \in \mathbb{R} \mid x<b\} \text { or }(-\infty, \infty)=\mathbb{R} .$ <br> A closed unbounded interval is a set of the form $[a, \infty)=\{x \in \mathbb{R} \mid a \leq x\} \text { or }(-\infty, b]=\{x \in \mathbb{R} \mid x \leq b\} .$ |
| :---: | :---: |
| Interval Types | - An open interval is either an open bounded interval or an open unbounded interval. <br> - A closed interval is either a closed bounded interval or a closed unbounded interval. <br> - A right unbounded interval is any interval of the form $(a, \infty),[a, \infty)$ or $(-\infty, \infty)$. <br> - A left unbounded interval is any interval of the form $(-\infty, b),(-\infty, b]$ or $(-\infty, \infty)$. <br> - A non-degenerate interval is any interval of the form $(a, b),(a, b],[a, b)$ or $[a, b]$ where $a<b$, or any unbounded interval. <br> - The number $a$ in intervals of the form $[a, b),[a, b]$ or $[a, \infty)$ is called the left endpoint of the interval. <br> - The number $b$ in intervals of the form $(a, b],[a, b]$ or $(-\infty, b]$ is called the right endpoint of the interval. <br> - An endpoint of an interval is either a left endpoint or a right endpoint. <br> - The interior of an interval is everything in the interval other than its endpoints. |
| Intervals <br> (Lemma 2.3.7) | Let $\mathrm{I} \subseteq \mathbb{R}$ be an interval. <br> 1. If $x, y \in I$ and $x \leq y$, then $[x, y] \subseteq I$. <br> 2. If $I$ is an open interval, and if $x \in I$, then there is some $\delta>0$ such that [ $x$ $-\delta, x+\delta] \subseteq 1$. |
| Absolute Value (Definition 2.3.8) | Let $a \in \mathbb{R}$. The absolute value of $a$, denoted $\|a\|$, is defined by $\|a\|=$ (a, if $a \geq 0-a$, if $a<0$. |
| Properties of Absolute Value (Lemma 2.3.9) | Let $a, b \in \mathbb{R}$. <br> 1. $\|a\| \geq 0$, and $\|a\|=0$ if and only if $a=0$. <br> 2. $-\|a\| \leq a \leq\|a\|$. <br> 3. $\|a\|=\|b\|$ if and only if $a=b$ or $a=-b$. <br> 4. $\|a\|<b$ if and only if $-b<a<b$, and $\|a\| \leq b$ if and only if $-b \leq a \leq b$. <br> 5. $\|a b\|=\|a\| \cdot\|b\|$. <br> 6. $\|a+b\| \leq\|a\|+\|b\|$ <br> (Triangle Inequality). <br> 7. $\|\|a\|-\|b\|\| \leq\|a+b\|$ and $\|\|a\|-\|b\|\| \leq\|a-b\|$. |
| Epsilon: $\boldsymbol{\varepsilon} \approx 0$ <br> (Lemma 2.3.10) | Let $a \in \mathbb{R}$. <br> 1. a $\leq 0$ if and only if $\mathrm{a}<\varepsilon$ for all $\varepsilon>0$. <br> 2. a $\geq 0$ if and only if $a>-\varepsilon$ for all $\varepsilon>0$. <br> 3. $a=0$ if and only if $\|a\|<\varepsilon$ for all $\varepsilon>0$. |

### 2.4 Real Numbers Include Natural, Integers, and Rationals $(\mathbb{N} \subset \mathbb{Z} \subset \mathbb{Q} \subset \mathbb{R})$

## Theorem / Lemma / <br> Definition / Corollary

## Description

| Inductive Set (Definition 2.4.1) | Let $S \subseteq \mathbb{R}$ be a set. The set $S$ is inductive if it satisfies the following two properties. <br> (a) $1 \in S$. <br> (b) If $a \in S$, then $a+1 \in S$. |
| :---: | :---: |
| Definition: $\mathbb{N}$ <br> (Definition 2.4.2) | The set of natural numbers, denoted $\mathbb{N}$, is the intersection of all inductive subsets of $\mathbb{R}$. |
| Properties of $\mathbb{N}$ (Lemma 2.4.3) | 1. $\mathbb{N}$ is inductive. <br> 2. If $A \subseteq \mathbb{R}$ and $A$ is inductive, then $\mathbb{N} \subseteq A$. <br> 3. If $n \in \mathbb{N}$ then $n \geq 1$. |
| Peano Postulates (Theorem 2.4.4) | Let $\mathrm{s}: \mathrm{N} \rightarrow \mathrm{N}$ be defined by $\mathrm{s}(\mathrm{n})=\mathrm{n}+1$ for all $\mathrm{n} \in \mathbb{N}$. <br> a. There is no $n \in \mathbb{N}$ such that $s(n)=1$. <br> b. The function $s$ is injective. <br> c. Let $G \subseteq \mathbb{N}$ be a set. Suppose that $1 \in G$, and that if $g \in G$ then $\mathrm{s}(\mathrm{g}) \in \mathrm{G}$. Then $\mathrm{G}=\mathbb{N}$. |
| $\mathbb{N}$ Closed Under + (Lemma 2.4.5) | Let $\mathrm{a}, \mathrm{b} \in \mathbb{N}$. Then $\mathrm{a}+\mathrm{b} \in \mathbb{N}$ and $\mathrm{ab} \in \mathbb{N}$. |
| Well-Ordering Principle (Theorem 2.4.6) | Let $\mathrm{G} \subseteq \mathbb{N}$ be a non-empty set. Then there is some $m \in G$ such that $\mathrm{m} \leq \mathrm{g}$ for all $\mathrm{g} \in \mathrm{G}$. |
| Definition: $\mathbb{Z}$ (Definition 2.4.7) | Let $-\mathbb{N}=\{x \in \mathbb{R} \mid x=-n$ for some $n \in \mathbb{N}\}$. <br> The set of integers, denoted $\mathbb{Z}$, is defined by $\mathbb{Z}=-\mathbb{N} \cup\{0\} \cup \mathbb{N}$. |
| Properties of $\mathbb{Z}$ (Lemma 2.4.8) | 1. $\mathbb{N} \subseteq \mathbb{Z}$. <br> 2. $a \in \mathbb{N}$ if and only if $a \in \mathbb{Z}$ and $a>0$. <br> 3. The three sets $-\mathbb{N},\{0\}$ and $\mathbb{N}$ are mutually disjoint. |
| $\mathbb{Z}$ Closed Under + , • , (Lemma 2.4.9) | Let $\mathrm{a}, \mathrm{b} \in \mathbb{Z}$. Then $\mathrm{a}+\mathrm{b} \in \mathbb{Z}$, and $\mathrm{ab} \in \mathbb{Z}$, and $-\mathrm{a} \in \mathbb{Z}$. |
| Integers are Discrete (Theorem 2.4.10) | Let $\mathrm{a}, \mathrm{b} \in \mathbb{Z}$. <br> 1. If $a<b$ then $a+1 \leq b$. <br> 2. There is no $c \in \mathbb{Z}$ such that $a<c<a+1$. <br> 3. If $\|a-b\|<1$ then $a=b$. |
| Definition: <br> (Definition 2.4.11) | The set of rational numbers, denoted $\mathbb{Q}$, is defined by $\mathbb{Q}=\{x \in \mathbb{R} \mid x=a / b \text { for some } a, b \in \mathbb{Z} \text { such that } b \neq 0\} .$ <br> The set of irrational numbers is the set $\mathbb{R}-\mathbb{Q}$. |
| Properties of $\mathbb{Q}$ <br> (Lemma 2.4.12) | 1. $\mathbb{Z} \subseteq \mathbb{Q}$. <br> 2. $q \in \mathbb{Q}$ and $q>0$ if and only if $q=a / b$ for some $a, b \in \mathbb{N}$. |

| Fraction Manipulation (Lemma 2.4.13) | Let $\mathrm{a}, \mathrm{b}, \mathrm{c}, \mathrm{d} \in \mathbb{Z}$. Suppose that $\mathrm{b} \neq 0$ and $\mathrm{d} \neq 0$. <br> 1. $a / b=0$ if and only if $a=0$. <br> 2. $a / b=1$ if and only if $a=b$. <br> 3. $a / b=c / d$ if and only if $a d=b c$. <br> 4. $a / b+c / d=(a d+b c) / b d$. <br> 5. $-(a / b)=(-a) / b=a /(-b)$. <br> 6. $a / b \cdot c / d=a c / b d$. <br> 7. If $a \neq 0$, then $(a / b)^{-1}=b / a$. |
| :---: | :---: |
| $\mathbb{Q}$ Closed Under $+, \cdot,-,^{-1}$ (Corollary 2.4.14) | Let $\mathrm{a}, \mathrm{b} \in \mathbb{Q}$. Then $\mathrm{a}+\mathrm{b} \in \mathbb{Q}$, and $\mathrm{ab} \in \mathbb{Q}$, and $-\mathrm{a} \in \mathbb{Q}$, and if $\mathrm{a} \neq 0$ then $a^{-1} \in \mathbb{Q}$. |

## Ch. 2.5: Induction and Recursion

| Proposition / Theorem / Lemma / Definition | Description |
| :---: | :---: |
| Principle of Mathematical Induction <br> (Theorem 2.5.1) | Let $\mathrm{G} \subseteq \mathbb{N}$. Suppose that <br> a. $1 \in \mathrm{G}$; <br> b. if $\mathrm{n} \in \mathrm{G}$, then $\mathrm{n}+1 \in \mathrm{G}$. <br> Then $\mathrm{G}=\mathbb{N}$. |
| Proposition 2.5.2 | Example induction proof |
| Definition 2.5.3 | Let $\mathrm{a}, \mathrm{b} \in \mathbb{Z}$. <br> The set $\{\mathrm{a}, \ldots, \mathrm{b}\}$ is defined $\mathrm{by}\{\mathrm{a}, \ldots, \mathrm{b}\}=\{\mathrm{x} \in \mathbb{Z} \mid \mathrm{a} \leq \mathrm{x} \leq \mathrm{b}\}$. |
| Principle of Mathematical <br> Induction- <br> Variant/Complete <br> (Theorem 2.5.4) | Let $\mathrm{G} \subseteq \mathbb{N}$. Suppose that <br> a. $1 \in \mathrm{G}$; <br> b. if $\mathrm{n} \in \mathbb{N}$ and $\{1, \ldots, \mathrm{n}\} \subseteq \mathrm{G}$, then $\mathrm{n}+1 \in \mathrm{G}$. <br> Then $\mathrm{G}=\mathbb{N}$. |
| Definition by Recursion (Theorem 2.5.5) | Let H be a set, let $\mathrm{e} \in \mathrm{H}$ and let $\mathrm{k}: \mathrm{H} \rightarrow \mathrm{H}$ be a function. Then there is a unique function $f: \mathbb{N} \rightarrow H$ such that $f(1)=e$, and that $f(n$ $+1)=k(f(n))$ for all $n \in \mathbb{N}$. |
| Definition of $x^{n}$ Definition 2.5.6 | Let $x \in \mathbb{R}$. The number $x^{n} \in \mathbb{R}$ is defined for all $n \in \mathbb{N}$ by letting $x^{1}=$ x , and $\mathrm{x}^{\mathrm{n}+1}=\mathrm{x} \cdot \mathrm{x}^{\mathrm{n}}$ for all $\mathrm{x} \in \mathbb{N}$. |
| Lemma 2.5.7 | Let $\mathrm{x} \in \mathbb{R}$. Suppose that $\mathrm{x} \neq 0$. Then $\mathrm{x}^{\mathrm{n}} \neq 0$ for all $\mathrm{n} \in \mathbb{N}$. |
| Definition: $\mathrm{x}^{0}$ <br> Definition 2.5.8 | Let $x \in \mathbb{R}$. Suppose that $x \neq 0$. <br> The number $x^{0} \in \mathbb{R}$ is defined by $x^{0}=1$. <br> For each $n \in \mathbb{N}$, the number $x^{-n}$ is defined by $x^{-n}=\left(x^{n}\right)^{-1}$. |
| Power Rules Lemma 2.5.9 | Let $x \in \mathbb{R}$, and let $n, m \in \mathbb{Z}$. Suppose that $x \neq 0$. <br> 1. $x^{n} x^{m}=x^{n+m}$. <br> 2. $x^{n} / x^{m}=x^{n-m}$. |
| Polynomial Function Definition 2.5.10 | Let $A \subseteq \mathbb{R}$ be a set, and let $f: A \rightarrow \mathbb{R}$ be a function. The function $f$ is a polynomial function if there are some $n \in \mathbb{N} \cup\{0\}$ and $a_{0}, a_{1}, \ldots$, , $a_{n} \in \mathbb{R}$ such that $f(x)=a_{0}+a_{1} x+\cdots+a_{n} x^{n}$ for all $x \in A$. |
| $\begin{aligned} & a_{n+1}=n+a_{n} \\ & \text { Theorem 2.5.11 } \end{aligned}$ | Let H be a set, let $\mathrm{e} \in \mathrm{H}$ and let $\mathrm{t}: \mathrm{H} \times \mathbb{N} \rightarrow \mathrm{H}$ be a function. Then there is a unique function $\mathrm{g}: \mathbb{N} \rightarrow \mathrm{H}$ such that $\mathrm{g}(1)=\mathrm{e}$, and that $\mathrm{g}(\mathrm{n}$ $+1)=t((g(n), n))$ for all $n \in \mathbb{N}$. |
| Factorial: n! <br> Example 2.5.12 | We want to define a sequence of real numbers $a_{1}, a_{2}, a_{3}, \ldots$ such that $\mathrm{a}_{1}=1$, and $\mathrm{a}_{\mathrm{n}+1}=(\mathrm{n}+1) \mathrm{a}_{\mathrm{n}}$ for all $\mathrm{n} \in \mathbb{N}$. |
| $\max ()$ Function (Example 2.5.13) | $\max \{x, y\}= \begin{cases}x, & \text { if } x \geq y \\ y, & \text { if } x \leq y\end{cases}$ |
| Exercise 2.5.3 | Let $\mathrm{n} \in \mathbb{N}$, and let $\mathrm{a}_{1}, \mathrm{a}_{2}, \ldots, \mathrm{a}_{\mathrm{n}} \in \mathbb{R}$. <br> Prove that $\left\|a_{1}+a_{2}+\cdots \cdot+a_{n}\right\| \leq\left\|a_{1}\right\|+\left\|a_{2}\right\|+\cdots \cdot+\left\|a_{n}\right\|$. |

## Ch. 2.6: The Least Upper Bound Property

| Theorem / Lemma / Corollary / Definition | Description |
| :---: | :---: |
| Example 2.6.1 | (1) Let $A=[3,5)$. Then 10 is an upper bound of $A$, and -100 is a lower bound. Hence $A$ is bounded above and bounded below, and therefore $A$ is bounded. |
| Unique LUB / GLB (Lemma 2.6.2) | Let $\mathrm{A} \subseteq \mathbb{R}$ be a non-empty set. <br> 1. If $A$ has a least upper bound, the least upper bound is unique. <br> 2. If $A$ has a greatest lower bound, the greatest lower bound is unique. |
| lub A / glb A (Definition 2.6.3) | Let $A \subseteq \mathbb{R}$ be a non-empty set. <br> If $A$ has a least upper bound, it is denoted lub A. <br> If $A$ has a greatest lower bound, it is denoted glb A. |
| Least Upper Bound Property (Theorem 1.7.9) | Let $\mathrm{A} \subseteq \mathbb{R}$ be a set. If A is nonempty and bounded above, then A has a least upper bound. |
| Greatest Lower Bound Property <br> (Theorem 2.6.4) | Let $A \subseteq \mathbb{R}$ be a set. If $A$ is non-empty and bounded below, then $A$ has a greatest lower bound. |
| Lemma 2.6.5 | Let $\mathrm{A} \subseteq \mathbb{R}$ be a non-empty set, and let $\varepsilon>0$. <br> 1. Suppose that $A$ has a least upper bound. Then there is some $a \in$ A such that lub $A-\varepsilon<a \leq \operatorname{lub} A$. <br> 2. Suppose that $A$ has a greatest lower bound. Then there is some $\mathrm{b} \in \mathrm{A}$ such that glb $\mathrm{A} \leq \mathrm{b}<\mathrm{glb} \mathrm{A}+\varepsilon$. |
| No Gap Lemma (Lemma 2.6.6) | Let $A, B \subseteq \mathbb{R}$ be non-empty sets. Suppose that if $a \in A$ and $b \in B$, then $\mathrm{a} \leq \mathrm{b}$. <br> 1. A has a least upper bound and $B$ has a greatest lower bound, and lub $A \leq g l b B$. <br> 2. lub $A=g l b B$ if and only if for each $\varepsilon>0$, there are $a \in A$ and $b \in$ $B$ such that $b-a<\varepsilon$. |
| Archimedean Property (Theorem 2.6.7) | Let $a, b \in \mathbb{R}$. Suppose that $a>0$. <br> Then there is some $n \in \mathbb{N}$ such that $b<n a$. |
| $\mathbb{R}$ In-between $\mathbb{Z}$ s (Corollary 2.6.8) | Let $x \in \mathbb{R}$. <br> 1. There is a unique $n \in \mathbb{Z}$ such that $n-1 \leq x<n$. If $x \geq 0$, then $n \in$ $\mathbb{N}$. <br> 2. If $x>0$, there is some $m \in \mathbb{N}$ such that $1 / m<x$. |
| Square Root <br> Theorem 2.6.9 | Let $p \in(0, \infty)$. Then there is a unique $x \in(0, \infty)$ such that $x^{2}=p$. |
| Square Root: <br> Definition 2.6.10 | Let $p \in(0, \infty)$. The square root of $p$, denoted $\sqrt{ } p$, is the unique $x$ $\in(0, \infty)$ such that $x^{2}=p$. |
| $\sqrt{ } 2$ is Irrational (Theorem 2.6.11) | Let $p \in \mathbb{N}$. Suppose that there is no $u \in \mathbb{Z}$ such that $p=u^{2}$. Then $\sqrt{ } \boldsymbol{p} \notin \mathbb{Q}$. |

| $\mathbb{Q} \neq$ LUB <br> (Corollary 2.6.12) | The ordered field $\mathbb{Q}$ does not satisfy the Least Upper Bound <br> Property. |
| :--- | :--- |
| $\mathbb{R}$ Sandwich | Let $\mathrm{a}, \mathrm{b} \in \mathbb{R}$. Suppose that $\mathrm{a}<\mathrm{b}$. |
| (Theorem 2.6.13) | 1. There is some $\mathrm{q} \in \mathbb{Q}$ such that $\mathrm{a}<\mathrm{q}<\mathrm{b}$. |
|  | 2. There is some $\mathrm{r} \in \mathbb{R}-\mathbb{Q}$ such that $\mathrm{a}<\mathrm{r}<\mathrm{b}$. |
|  | Let $\mathrm{C} \subseteq \mathbb{R}$ be a closed bounded interval, let I be a non-empty set |
| Heine-Borel Theorem | and let $\left\{A_{i}\right\}_{i \in \mathrm{I}}$ be a family of open intervals in $\mathbb{R}$. Suppose that <br> (Theorem 2.6.14) <br>  <br>  <br>  <br>  <br> $\subseteq \bigcup_{i \in \mathrm{I}} A_{i}$. Then there are $\mathrm{n} \in \mathbb{N}$ and $\mathrm{i}_{1}, \mathrm{i}_{2}, \ldots, \mathrm{i}_{\mathrm{n}} \in \mathrm{I}$ such that |
| $\mathrm{C} \subseteq \bigcup_{k=1}^{n} A_{i_{k}}$. |  |

## Ch. 2.7: Uniqueness of the Real Numbers

| Theorem | $\quad$Description <br>  <br> Uniqueness of the Real <br> NumbersLet $R_{1}$ and $R_{2}$ be ordered fields that satisfy the Least Upper Bound <br> Property. Then there is a function $f: R_{1} \rightarrow R_{2}$ that is bijective, and <br> that satisfies the following properties. <br> (Theorem 2.7.1) <br> Let $x, y \in R_{1}$. <br>  <br>  <br>  <br>  <br> a. $f(x+y)=f(x)+f(y)$. <br> b. $f(x y)=f(x) f(y)$. <br> c. If $x<y$, then $f(x)<f(y)$. |
| :--- | :--- |

## Ch. 2.8: Decimal Expansion of Real Numbers

## Theorem / Lemma / <br> Definition

## Description

| Base-p <br> (Lemma 2.8.1) | Let $\mathrm{p} \in \mathbb{N}$. Suppose that $\mathrm{p}>1$. Let $\mathrm{n} \in \mathbb{N}$. Then there is a unique $\mathrm{k} \in$ $\mathbb{N}$ such that $\mathrm{p}^{\mathrm{k}-1} \leq \mathrm{n}<\mathrm{p}^{\mathrm{k}}$. |
| :---: | :---: |
| Base-p Numbers <br> (Theorem 2.8.2) | Let $\mathrm{p} \in \mathbb{N}$. Suppose that $\mathrm{p}>1$. Let $\mathrm{n} \in \mathbb{N}$. Then there are unique $\mathrm{k} \in$ $\mathbb{N}$ and $a_{0}, a_{1}, \ldots, a_{k-1} \in\{0, \ldots, p-1\}$ such that $a_{k-1} \neq 0$, and that $n=\sum_{i=0}^{k-1} a_{i} p^{i}$ |
| Base-p Fractions (Lemma 2.8.3) | Let $p \in \mathbb{N}$. Suppose that $p>1$. Let $a_{1}, a_{2}, a_{3}, \ldots \in\{0, \ldots, p-1\}$. Then the set $\left\{\sum_{i=1}^{n} a_{i} p^{-i} \mid n \in \mathbb{N}\right\}$ |

is bounded below by 0 and is bounded above by $1 .[0,1]$
Let $p \in \mathbb{N}$. Suppose that $p>1$. Let $a_{1}, a_{2}, a_{3}, \ldots \in\{0, \ldots, p-1\}$. The sum $\sum_{i=1}^{\infty} a_{i} p^{-i}$ is defined by

Definition 2.8.4

$$
\sum_{i=1}^{\infty} a_{i} p^{-i}=l u b\left\{\sum_{i=1}^{n} a_{i} p^{-i} \mid n \in \mathbb{N}\right\}
$$

Let $p \in \mathbb{N}$. Suppose that $p>1$. Let $a_{1}, a_{2}, a_{3}, \ldots \in\{0, \ldots, p-1\}$.

1. $0 \leq \sum_{i=1}^{\infty} a_{i} p^{-i} \leq 1$.
2. $\sum_{i=1}^{\infty} a_{i} p^{-i}=0$ if and only if $\mathrm{a}_{\mathrm{i}}=0$ for all $\mathrm{i} \in \mathbb{N}$.
3. $\sum_{i=1}^{\infty} a_{i} p^{-i}=1$ if and only if $\mathrm{a}_{\mathrm{i}}=\mathrm{p}-1$ for all $\mathrm{i} \in \mathbb{N}$.
4. Let $\mathrm{m} \in \mathbb{N}$. Suppose that $\mathrm{m}>1$, and that $\mathrm{a}_{\mathrm{m}-1} \neq \mathrm{p}-1$. Then

Lemma 2.8.5

$$
\sum_{i=1}^{\infty} a_{i} p^{-i} \leq \sum_{i=1}^{\mathrm{m}-2} a_{i} p^{-i}+\frac{a_{m-1}+1}{p^{m-1}}
$$

where equality holds if and only if $\mathrm{a}_{\mathrm{i}}=\mathrm{p}-1$ for all $\mathrm{i} \in \mathbb{N}$ such that i $\geq \mathrm{m}$.

| Uniqueness of $\mathbb{R}$ <br> (Theorem 2.8.6) | Let $p \in \mathbb{N}$. Suppose that $p>1$. Let $x \in(0, \infty)$. <br> 1. There are $k \in \mathbb{N}$, and $b_{0}, b_{1}, \ldots, b_{k-1} \in\{0, \ldots, p-1\}$ and $a_{1}, a_{2}, a_{3} \ldots$ $\in\{0, \ldots, p-1\}$, such that $x=\sum_{j=0}^{\mathrm{k}-1} b_{j} p^{j}+\sum_{i=1}^{\infty} a_{i} p^{-i}$ <br> 2. It is possible to choose $k \in \mathbb{N}$, and $b_{0}, b_{1}, \ldots, b_{k-1} \in\{0, \ldots, p-1\}$, and $a_{1}, a_{2}, a_{3} \ldots \in\{0, \ldots, p-1\}$ in Part (1) of this theorem such that there is no $m \in \mathbb{N}$ such that $a_{i}=p-1$ for all $i \in \mathbb{N}$ such that $i \geq m$. <br> 3. If $x>1$, then it is possible to choose $k \in \mathbb{N}$, and $b_{0}, b_{1}, \ldots, b_{k-1} \in$ $\{0, \ldots, p-1\}$, and $a_{1}, a_{2}, a_{3} \ldots \in\{0, \ldots, p-1\}$ in Part (1) of this theorem such that $b_{k-1} \neq 0$. <br> If $0<x<1$, then it is possible to choose $k=1$, and $b_{0}=0$, and $a_{1}, a_{2}$, $a_{3} \ldots \in\{0, \ldots, p-1\}$ in Part (1) of this theorem. <br> 4. If the conditions of Parts (2) and (3) of this theorem hold, then the numbers $k \in \mathbb{N}$, and $b_{0}, b_{1}, \ldots, b_{k-1} \in\{0, \ldots, p-1\}$, and $a_{1}, a_{2}, a_{3}$ $\ldots \in\{0, \ldots, p-1\}$ in Part (1) are unique. |
| :---: | :---: |
| Base p Representation ( $\mathrm{b}_{\mathrm{j}}$. $\mathrm{a}_{\mathrm{i}}$ ) <br> (Definition 2.8.7) | Let $p \in \mathbb{N}$. Suppose that $p>1$. Let $x \in(0, \infty)$. A base $p$ <br> representation of the number x is an expression of the form $\mathrm{x}=$ $b_{k-1} \cdots b_{1} b_{0} . a_{1} a_{2} a_{3} \cdots$, where $k \in \mathbb{N}$ and $b_{0}, b_{1}, \ldots, b_{k-1} \in\{0, \ldots, p-1\}$ and $a_{1}, a_{2}, a_{3} \ldots \in\{0, \ldots, p-1\}$ are such that $x=\sum_{j=0}^{\mathrm{k}-1} b_{j} p^{j}+\sum_{i=1}^{\infty} a_{i} p^{-i}$ |
| Division Algorithm: - <br> (Theorem 2.8.8) | Let $\mathrm{a} \in \mathbb{N} \cup\{0\}$ and $\mathrm{b} \in \mathbb{N}$. Then there are unique $\mathrm{q}, \mathrm{r} \in \mathbb{N} \cup\{0\}$ such that $a=b q+r$ and $0 \leq r<b . \quad(q=q u o t i e n t, r=$ remainder $)$ |
| Repeating Decimal (Definition 2.8.9) | Let $p \in \mathbb{N}$. Suppose that $p>1$. Let $x \in(0, \infty)$, and let $x=b_{k-1} \cdots$ $b_{1} b_{0} \cdot a_{1} a_{2} a_{3} \cdots$ be a base $p$ representation of $x$. This base $p$ representation is eventually repeating if there are some $r, s \in \mathbb{N}$ such that $a_{j}=a_{j+s}$ for all $j \in \mathbb{N}$ such that $j \geq r$; in that case we write $\mathrm{x}=b_{k-1} \cdots b_{1} b_{0} . a_{1} a_{2} a_{3} \cdots a_{r-1} \overline{a_{r} \cdots a_{\mathrm{r}+\mathrm{s}-1}} .$ |
| Rational if Repeating Decimal <br> (Theorem 2.8.10) | Let $p \in \mathbb{N}$. Suppose that $p>1$. Let $x \in(0, \infty)$. Then $x \in \mathbb{Q}$ if and only if $x$ has an eventually repeating base $p$ representation. |

## Ch. 3.2 Limits of Functions

| Theorem / Lemma / Definition | Description |
| :---: | :---: |
| Limit of a Function (Definition 3.2.1) | Let $I \subseteq \mathbb{R}$ be an open interval, let $\mathrm{c} \in \mathrm{I}$, let $\mathrm{f}: \mathrm{I}-\{\mathrm{c}\} \rightarrow \mathbb{R}$ be a function and let $L \in \mathbb{R}$. The number $L$ is the limit of $f$ as $x$ goes to $c$, written $\lim _{x \rightarrow c} f(x)=L$ <br> if for each $\varepsilon>0$, there is some $\delta>0$ such that $\mathrm{x} \in \mathrm{I}-\{\mathrm{c}\}$ and $0<\mid \mathrm{x}$ $-\mathrm{c} \mid<\delta$ imply $\|\mathrm{f}(\mathrm{x})-\mathrm{L}\|<\varepsilon$. <br> If $\lim _{x \rightarrow c} f(x)=L$, we also say that f converges to L as x goes to c . <br> If f converges to some real number as x goes to c , we say that $\lim _{x \rightarrow c} f(x)$ exists. <br> An open interval is an interval that does not include its end points. |
| Logical Form of Limits | $(\forall \varepsilon>0)(\exists \delta>0)[(x \in I-\{c\} \wedge\|x-c\|<\delta) \rightarrow\|f(x)-L\|<\varepsilon]$ <br> The order of the quantifiers in the definition of limits is absolutely crucial. |
| Proof Format | A typical proof that $\lim _{x \rightarrow c} f(x)=L$ must therefore have the following form: <br> Proof. <br> Let $\varepsilon>0$ $\ldots(\operatorname{argumentation}) \ldots$ Let $\delta=f(\varepsilon)$ $\ldots(\operatorname{argumentation}) \ldots$ <br> Suppose that $x \in I-\{c\}$ and $\|x-c\|<\delta$ <br> .... (argumentation)... <br> Therefore $\|f(x)-\mathrm{L}\|<\varepsilon$. |
| L is Unique (Lemma 3.2.2) | Let $\mathrm{I} \subseteq \mathbb{R}$ be an open interval, let $\mathrm{c} \in \mathrm{I}$ and let $\mathrm{f}: \mathrm{I}-\{\mathrm{c}\} \rightarrow \mathbb{R}$ be a function. If $\lim _{x \rightarrow c} f(x)=L$ for some $L \in \mathbb{R}$, then $L$ is unique. |
| Example Proofs (Example 3.2.3) | (1) Prove that $\lim _{x \rightarrow 4}(5 x+1)=21$. <br> Proof: <br> Let $\varepsilon>0$. Let $\delta=\varepsilon 5$. Suppose that $x \in \mathbb{R}-\{4\}$ and $\|x-4\|<\delta$. Then $\|(5 x+1)-21\|=\|5 x-20\|=5\|x-4\|<5 \delta=5 \cdot \varepsilon 5=\varepsilon$. |
|  | (2) Prove that $\lim _{x \rightarrow 3}\left(x^{2}-1\right)=8$. <br> Proof: <br> Let $\varepsilon>0$. Let $\delta=\min \{\varepsilon 7,1\}$. Suppose that $x \in \mathbb{R}-\{3\}$ and $\|x-3\|<$ <br> $\delta$. Then $\|x-3\|<1$, which implies that $-1<x-3<1$, and therefore 2 $<x<4$, and hence $5<x+3<7$, and we conclude that $5<\|x+3\|<$ <br> 7. Then $\|(x 2-1)-8\|=\|x 2-9\|=\|x-3\| \cdot\|x+3\|<\delta \cdot 7 \leq \varepsilon 7 \cdot 7=$ <br> $\varepsilon$. |

|  | (3) Prove that $\lim _{x \rightarrow 0}\left(\frac{1}{x}\right)$. does not exist. <br> Proof: <br> Suppose that $\lim _{x \rightarrow 0}\left(\frac{1}{x}\right)=L$ for some $L \in \mathbb{R}$. Let $\varepsilon=\|L\| / 2$ if $L \neq 0$, and let $\varepsilon=1$ if $L=0$. We consider the case when $L>0$; the other cases are similar. Let $\delta>0$. Because $\mathrm{L}>0$, then $\mathrm{L}+\varepsilon>0$. Let $\mathrm{x}=$ $\min \{\delta / 2,1 /(L+\varepsilon)\}$. Then $x \in(0, \infty)$ and $\|x-0\| \leq \delta / 2<\delta$. On the other hand, because $x \leq 1 /(L+\varepsilon)$, it follows that $L+\varepsilon \leq 1 / x$, and hence $1 / x-L \geq \varepsilon$, which implies that $\|1 / x-L\| \nless \varepsilon$. |
| :---: | :---: |
| Sign-Preserving Property for Limits <br> (Theorem 3.2.4) | Let $\mathrm{I} \subseteq \mathbb{R}$ be an open interval, let $\mathrm{c} \in \mathrm{I}$ and let $\mathrm{f}: \mathrm{I}-\{\mathrm{c}\} \rightarrow \mathbb{R}$ be a function. Suppose that $\lim _{x \rightarrow c} f(x)$ exists. <br> 1. If $\lim _{x \rightarrow c} f(x)>0$, then there is some $\mathrm{M}>0$ and some $\delta>0$ such that $\mathrm{x} \in \mathrm{I}-\{\mathrm{c}\}$ and $\|\mathrm{x}-\mathrm{c}\|<\delta$ imply $\mathrm{f}(\mathrm{x})>\mathrm{M}$. <br> 2. If $\lim _{x \rightarrow c} f(x)<0$, then there is some $\mathrm{N}<0$ and some $\delta>0$ such that $\mathrm{x} \in \mathrm{I}-\{\mathrm{c}\}$ and $\|\mathrm{x}-\mathrm{c}\|<\delta$ imply $\mathrm{f}(\mathrm{x})<\mathrm{N}$. |
| Bounded <br> (Lemma 3.2.7) | Let $\mathrm{I} \subseteq \mathbb{R}$ be an open interval, let $\mathrm{c} \in \mathrm{I}$ and let $\mathrm{f}: \mathrm{I}-\{\mathrm{c}\} \rightarrow \mathbb{R}$ be a function. If $\lim _{x \rightarrow c} f(x)$ exists, then there is some $\delta>0$ such that the restriction of $f$ to $(I-\{c\}) \cap(c-\delta, c+\delta)$ is bounded. |
| Zero <br> (Lemma 3.2.8) | Let $I \subseteq \mathbb{R}$ be an open interval, let $\mathrm{c} \in \mathrm{I}$ and let $\mathrm{f}, \mathrm{g}: \mathrm{I}-\{\mathrm{c}\} \rightarrow \mathbb{R}$ be functions. Suppose that $\lim _{x \rightarrow c} f(x)=0$, and that g is bounded. Then $\lim _{x \rightarrow c} f(x) g(x)=0$. |
| Functions for $+,-, k, \bullet, \div$ (Definition 3.2.9) | Let $A, B$ be sets, let $\mathrm{f}: \mathrm{A} \rightarrow \mathbb{R}$ and $\mathrm{g}: \mathrm{B} \rightarrow \mathbb{R}$ be functions and let $\mathrm{k} \in$ $\mathbb{R}$. <br> 1. The function $f+g: A \cap B \rightarrow \mathbb{R}$ is defined by $[f+g](x)=f(x)+g(x)$ for all $x \in A \cap B$. <br> 2. The function $f-g: A \cap B \rightarrow \mathbb{R}$ is defined by $[f-g](x)=f(x)-g(x)$ for all $x \in A \cap B$. <br> 3. The function $k f: A \rightarrow \mathbb{R}$ is defined by $[k f](x)=k f(x)$ for all $x \in A$. <br> 4. The function $f \cdot g: A \cap B \rightarrow \mathbb{R}$ is defined by $[f \cdot g](x)=f(x) \cdot g(x)$ for all $x \in A \cap B$. <br> 5. Let $C=(A \cap B)-\{b \in B \mid g(b)=0\}$. The function $f g: C \rightarrow \mathbb{R}$ is defined by $[f / g](x)=f(x) / g(x)$ for all $x \in C$. <br> 6. The function $\|f\|: A \rightarrow \mathbb{R}$ is defined by $\|f\|(x)=\|f(x)\|$ for all $x$ $\in A$. |

| Limits for $+,-, k, \bullet, \div$ <br> (Theorem 3.2.10) | Let $\mathrm{I} \subseteq \mathbb{R}$ be an open interval, let $\mathrm{c} \in \mathrm{I}$, let $\mathrm{f}, \mathrm{g}: \mathrm{I}-\{\mathrm{c}\} \rightarrow \mathbb{R}$ be functions and let $\mathrm{k} \in \mathbb{R}$. Suppose that $\lim _{x \rightarrow c} f(x)$ and $\lim _{x \rightarrow c} g(x)$ exist. <br> 1. $\lim _{x \rightarrow c}[f+g](x)$ exists and $\lim _{x \rightarrow c}[f+g](x)=\lim _{x \rightarrow c} f(x)+$ $\lim _{x \rightarrow c} g(x)$. <br> 2. $\lim _{x \rightarrow c}[f-g](x)$ exists and $\lim _{x \rightarrow c}[f-g](x)=\lim _{x \rightarrow c} f(x)-$ $\lim _{x \rightarrow c} g(x)$. <br> 3. $\lim _{x \rightarrow c}[k \cdot f](x)$ exists and $\lim _{x \rightarrow c}[k \cdot f](x)=k \cdot \lim _{x \rightarrow c} f(x)$. <br> 4. $\lim _{x \rightarrow c}[f \cdot g](x)$ exists and $\lim _{x \rightarrow c}[f \cdot g](x)=\lim _{x \rightarrow c} f(x) \cdot \lim _{x \rightarrow c} g(x)$. <br> 5. $\lim _{x \rightarrow c}\left[\frac{f}{g}\right](x)$ exists and $\lim _{x \rightarrow c}\left[\frac{f}{g}\right](x)=\frac{\lim _{x \rightarrow c} f(x)}{\lim g(x)}$ if $\lim _{x \rightarrow c} g(x) \neq 0$. |
| :---: | :---: |
| Limits for $\mathrm{f} \circ \mathrm{g}$ <br> (Theorem 3.2.12) | Let $\mathrm{I}, \mathrm{J} \subseteq \mathbb{R}$ be open intervals, let $\mathrm{c} \in \mathrm{I}$, let $\mathrm{d} \in \mathrm{J}$ and let $\mathrm{g}: \mathrm{I}-\{\mathrm{c}\} \rightarrow \mathrm{J}$ $-\{\mathrm{d}\}$ and $\mathrm{f}: \mathrm{J}-\{\mathrm{d}\} \rightarrow \mathbb{R}$ be functions. Suppose that $\lim _{y \rightarrow c} g(y)=d$ and that $\lim _{x \rightarrow d} f(x)$ exist. Then $\lim _{y \rightarrow c}(f \circ g)(y)$ exists, and $\lim _{y \rightarrow c}(f \circ g)(y)=\lim _{x \rightarrow d} f(x)$. |
| Limits: f $\leq \mathrm{g}$ <br> (Theorem 3.2.13) | Let $\mathrm{I} \subseteq \mathbb{R}$ be an open interval, let $\mathrm{c} \in \mathrm{I}$ and let $\mathrm{f}, \mathrm{g}: \mathrm{I}-\{\mathrm{c}\} \rightarrow \mathbb{R}$ be functions. Suppose that $\mathrm{f}(\mathrm{x}) \leq \mathrm{g}(\mathrm{x})$ for all $\mathrm{x} \in \mathrm{I}-\left\{\mathrm{cc}\right.$. If $\lim _{x \rightarrow c} f(x)$ and $\lim _{x \rightarrow c} g(x)$ exist, then $\lim _{x \rightarrow c} f(x) \leq \lim _{x \rightarrow c} g(x)$. |
| Squeeze Theorem for Functions (Theorem 3.2.14) | Let $\mathrm{I} \subseteq \mathbb{R}$ be an open interval, let $\mathrm{c} \in \mathrm{I}$ and let $\mathrm{f}, \mathrm{g}, \mathrm{h}: \mathrm{I}-\{\mathrm{c}\} \rightarrow \mathbb{R}$ be functions. Suppose that $\mathrm{f}(\mathrm{x}) \leq \mathrm{g}(\mathrm{x}) \leq \mathrm{h}(\mathrm{x})$ for all $\mathrm{x} \in \mathrm{I}-\{\mathrm{c}\}$. If $\lim _{x \rightarrow c} f(x)=L=\lim _{x \rightarrow c} h(x)$ for some $L \in \mathbb{R}$, then $\lim _{x \rightarrow c} g(x)$ exists and $\lim _{x \rightarrow c} g(x)=L$. |

| Left/Right Hand Limits (Definition 3.2.15) | Let $\mathrm{I} \subseteq \mathbb{R}$ be an interval, let $\mathrm{c} \in \mathrm{I}$, let $\mathrm{f}: \mathrm{I}-\{\mathrm{c}\} \rightarrow \mathbb{R}$ be a function and let $L \in \mathbb{R}$. <br> 1. Suppose that c is not a right endpoint of I . The number L is the right-hand limit of $f$ at $c$, written $\lim _{x \rightarrow c+} f(x)=L$ <br> if for each $\varepsilon>0$, there is some $\delta>0$ such that $\mathrm{x} \in \mathrm{I}-\{\mathrm{c}\}$ and $\mathrm{c}<\mathrm{x}<$ $\mathrm{c}+\delta$ imply $\|\mathrm{f}(\mathrm{x})-\mathrm{L}\|<\varepsilon$. If $\lim _{x \rightarrow c+} f(x)=L$, we also say that f converges to $L$ as x goes to c from the right. If f converges to some real number as x goes to c from the right, we say that $\lim _{x \rightarrow c+} f(x)$ exists. <br> 2. Suppose that $c$ is not a left endpoint of $I$. The number $L$ is the left-hand limit of $f$ at $c$, written $\lim _{x \rightarrow c-} f(x)=L$ <br> if for each $\varepsilon>0$, there is some $\delta>0$ such that $\mathrm{x} \in \mathrm{I}-\{\mathrm{c}\}$ and $\mathrm{c}-\delta<$ $\mathrm{x}<\mathrm{c}$ imply $\|\mathrm{f}(\mathrm{x})-\mathrm{L}\|<\varepsilon$. If $\lim _{x \rightarrow c-} f(x)=L$, we also say that f converges to $L$ as x goes to c from the left. If f converges to some real number as x goes to c from the left, we say that $\lim _{x \rightarrow c-} f(x)=L$, exists. <br> 3. A one-sided limit is either a right-hand limit or a left-hand limit. |
| :---: | :---: |
| All 3 Limits are Equal (Lemma 3.2.17) | Let $\mathrm{I} \subseteq \mathbb{R}$ be an open interval, let $\mathrm{c} \in \mathrm{I}$ and let $\mathrm{f}: \mathrm{I}-\{\mathrm{c}\} \rightarrow \mathbb{R}$ be a function. Then $\lim _{x \rightarrow c} f(x)$ exists if and only if $\lim _{x \rightarrow c+} f(x)$ and $\lim _{x \rightarrow c-} f(x)$ exist and are equal, and if these three limits exist then they are equal. |
| $\begin{aligned} & y=m x+b \\ & \text { (Exercise 3.2.1) } \end{aligned}$ | Let $m, b, c \in \mathbb{R}$. Using only the definition of limits, prove that $\lim _{x \rightarrow c}(m x+b)=m c+b$ |
| Exercise 3.2.5 | Let $\mathrm{J} \subseteq \mathrm{I} \subseteq \mathbb{R}$ be open intervals, let $\mathrm{c} \in \mathrm{J}$ and let $\mathrm{f}: \mathrm{I}-\{\mathrm{c}\} \rightarrow \mathbb{R}$ be a function. Prove that $\lim _{x \rightarrow c} f(x)$ exists if and only if $\left.\lim _{x \rightarrow c} f\right\|_{J}(x)$ exists, and if these limits exist, then they are equal. |

## Ch. 3.3 Continuity

| Theorem / Lemma / Corollary / Definition / Examples | Description |
| :---: | :---: |
| Continuity: $\varepsilon, \delta$ <br> (Definition 3.3.1) | Let $\mathrm{A} \subseteq \mathbb{R}$ be a set, and let $\mathrm{f}: \mathrm{A} \rightarrow \mathbb{R}$ be a function. <br> 1. Let $c \in A$. The function $f$ is continuous at $c$ if for each $\varepsilon>0$, there is some $\delta>0$ such that $\mathrm{x} \in \mathrm{A}$ and $\|\mathrm{x}-\mathrm{c}\|<\delta$ imply $\|\mathrm{f}(\mathrm{x})-\mathrm{f}(\mathrm{c})\|<\varepsilon$. The function $f$ is discontinuous at $c$ if $f$ is not continuous at $c$; in that case we also say that $f$ has a discontinuity at $c$. <br> 2. The function $f$ is continuous if it is continuous at every number in A . The function f is discontinuous if it is not continuous. |
| Continuity: $\mathrm{f}(\mathrm{c})$ <br> (Lemma 3.3.2) | Let $I \subseteq \mathbb{R}$ be an open interval, let $\mathrm{c} \in \mathrm{I}$ and let $\mathrm{f}: \mathrm{I} \rightarrow \mathbb{R}$ be a function. Then f is continuous at c if and only if $\lim _{x \rightarrow c} f(x)$ exists and $\lim _{x \rightarrow c} f(x)=f(c)$. |
| Logical Form of Continuity | ( $\forall c \in A$ ) [ $f$ is continuous at $c]$ which can be written completely in symbols as $(\forall c \in A)(\forall \varepsilon>0)(\exists \delta>0)[(x \in A \wedge\|x-c\|<\delta) \rightarrow\|f(x)-f(c)\|<\varepsilon] .$ <br> The order of the quantifiers is crucial. <br> Applies where we can find $\delta$ that depends upon $\varepsilon$ and c . |
| Example 3.3.3 | (1) $f(x)=m x+b$ <br> (2) $p(x)=1 / x$ <br> (3) Standard elementary functions (that is, polynomials, power functions, logarithms, exponentials and trigonometric functions). All of these functions are continuous. <br> (4) $y=\tan (x)$ <br> (5) $g(x)=\|x\| / x$ <br> (6) $r(x)=1$ or 0 <br> (7) $s(x)=1 / q$ |
| Sign-Preserving Property for Continuous Functions (Theorem 3.3.4) | Let $\mathrm{A} \subseteq \mathbb{R}$ be a non-empty set, let $\mathrm{c} \in \mathrm{A}$ and let $\mathrm{f}: \mathrm{A} \rightarrow \mathbb{R}$ be a function. Suppose that $f$ is continuous at $c$. <br> 1. If $f(c)>0$, then there is some $M>0$ and some $\delta>0$ such that $x \in$ $A$ and $\|x-c\|<\delta$ imply $f(x)>M$. <br> 2. If $\mathrm{f}(\mathrm{c})<0$, then there is some $\mathrm{N}<0$ and some $\delta>0$ such that $\mathrm{x} \in$ $A$ and $\|x-c\|<\delta$ imply $f(x)<N$. |
| $+,-, \cdot, \div$ Continuous at $\mathrm{x}=\mathrm{c}$ <br> (Theorem 3.3.5) | Let $A \subseteq \mathbb{R}$ be a non-empty set, let $c \in A$, let $f, g: A \rightarrow \mathbb{R}$ be functions and let $k \in \mathbb{R}$. Suppose that $f$ and $g$ are continuous at $c$. <br> 1. $f+g$ is continuous at c . <br> 2. $\mathrm{f}-\mathrm{g}$ is continuous at c . <br> 3. $k \cdot f$ is continuous at $c$. <br> 4. $f \cdot g$ is continuous at $c$. <br> 5. If $\mathrm{g}(\mathrm{c}) \neq 0$, then $\mathrm{f} / \mathrm{g}$ is continuous at c . |

| $+,-, \cdot, \div$ Continuous Everywhere (Corollary 3.3.6) | Let $A \subseteq \mathbb{R}$ be a non-empty set, let $f, g: A \rightarrow \mathbb{R}$ be functions and let $k$ $\in \mathbb{R}$. Suppose that $f$ and $g$ are continuous. Then $f+g, f-g, k \cdot f$ and $f \cdot g$ are continuous, and if $g(x) \neq 0$ for all $x \in I$ then $f / g$ is continuous. |
| :---: | :---: |
| Example 3.3.7 | (1) $f_{n}(x)=x^{n}$ <br> (2) $p(x)=1 / x$ |
| Composite Functions ( $\mathbf{f}{ }^{\mathbf{g}}$ ) (Theorem 3.3.8) | Let $A, B \subseteq \mathbb{R}$ be non-empty sets, let $c \in A$ and let $g: A \rightarrow B$ and $f: B$ $\rightarrow \mathbb{R}$ be functions. <br> 1. Suppose that A is an open interval. If $\lim _{x \rightarrow c} g(x)$ exists and is in B , and if f is continuous at $\lim _{x \rightarrow c} g(x)$, then $\lim _{x \rightarrow c} f(g(c))=\mathrm{f}\left(\lim _{x \rightarrow c} g(x)\right)$. 2. If g is continuous at c , and if f is continuous at $\mathrm{g}(\mathrm{c})$, then $\mathrm{f} \circ \mathrm{g}$ is continuous at c . <br> 3. If $g$ and $f$ are continuous, then $f \circ g$ is continuous. |
| Composition of Two Discontinuous Functions (Example 3.3.9) | (1) $\mathrm{h}(\mathrm{x})=1$ or $0, \mathrm{k}(\mathrm{x})=2$ or $0 \mathrm{~m} \rightarrow$ Better = Continuous <br> (2) $r(x)=1$ or $0, s(x)=1 / q \quad \rightarrow$ Worse Discontinuity |
| Pasting Lemma (Lemma 3.3.10) | Let $[\mathrm{a}, \mathrm{b}] \subseteq \mathbb{R}$ and $[\mathrm{b}, \mathrm{c}] \subseteq \mathbb{R}$ be non-degenerate closed bounded intervals, and let $\mathrm{f}:[\mathrm{a}, \mathrm{b}] \rightarrow \mathbb{R}$ and $\mathrm{g}:[\mathrm{b}, \mathrm{c}] \rightarrow \mathbb{R}$ be functions. Let h : $[a, c] \rightarrow \mathbb{R}$ be defined by $h(x)=(f(x)$, if $x \in[a, b], g(x)$, if $x \in[b, c]$. If $f$ and $g$ are continuous, and if $f(b)=g(b)$, then $h$ is continuous. |
| Extension of a Function (Example 3.3.11) | $\begin{aligned} & \mathrm{f}(\mathrm{x})=\mathrm{x} \quad \rightarrow \text { Can be extended } \\ & \mathrm{p}(\mathrm{x})=1 / \mathrm{x} \rightarrow \text { Cannot be extended } \end{aligned}$ |

## Ch. 3.4 Uniform Continuity

## Lemma / Corollary / <br> Definition / Examples

## Description

| Uniformly Continuous (UC) <br> (Definition 3.4.1) | Let $A \subseteq \mathbb{R}$ be a set, and let $f: A \rightarrow \mathbb{R}$ be a function. The function $f$ is <br> uniformly continuous if for each $\varepsilon>0$, there is some $\delta>0$ such <br> that $x, y \in A$ and $\|x-y\|<\delta$ imply $\|f(x)-f(y)\|<\varepsilon$. |
| :--- | :--- |
| Logical Form of UC | $(\forall \varepsilon>0)(\exists \delta>0)(\forall x \in A)(\forall y \in A)[\|x-y\|<\delta \rightarrow\|f(x)-f(y)\|<\varepsilon]$ <br> The order of the quantifiers is crucial. <br> Applies where we can find $\delta$ that depends only upon $\varepsilon$, and not $c$. |
| UC $\rightarrow$ C <br> (Lemma 3.4.2) | Let $A \subseteq \mathbb{R}$ be a set, and let $f: A \rightarrow \mathbb{R}$ be a function. If $f$ is uniformly <br> continuous, then $f$ is continuous. |
| Example 3.4.3 | $(1) f(x)=m x+b \quad$ Is UC <br> $(2) g(x)=1 / x$ where $x \in \mathbb{R}-\{0\} \rightarrow$ Is not UC <br> $(3) g(x)=1 / x$ where $x \in(1, \infty) \rightarrow I s \cup C$ |
| Close Bounded Interval C <br> $\rightarrow$ UC <br> (Theorem 3.4.4) | Let $C \subseteq \mathbb{R}$ be a closed bounded interval, and let $f: C \rightarrow \mathbb{R}$ be a <br> function. If $f$ is continuous, then $f$ is uniformly continuous. |
| UC Bounded <br> (Theorem 3.4.5) | Let $A \subseteq \mathbb{R}$ be a non-empty set, and let $f: A \rightarrow \mathbb{R}$ be a function. <br> Suppose that $A$ is bounded. If $f$ is uniformly continuous, then $f$ is <br> bounded. |
| C Bounded <br> (Corollary 3.4.6) | Let $C \subseteq \mathbb{R}$ be a closed bounded interval, and let $f: C \rightarrow \mathbb{R}$ be a <br> function. If $f$ is continuous, then $f$ is bounded. |

## Ch. 3.5 Two Important Theorems

| Axiom / Theorem / Lemma / Definition | Description |
| :---: | :---: |
| Extreme Value Theorem: <br> Min. and Max. Exist <br> (Theorem 3.5.1) | Let $C \subseteq \mathbb{R}$ be a closed bounded interval, and let $\mathrm{f}: \mathrm{C} \rightarrow \mathbb{R}$ be a function. Suppose that $f$ is continuous. Then there are $x_{\text {min }}, x_{\text {max }} \in C$ such that $f\left(x_{\text {min }}\right) \leq f(x) \leq f\left(x_{\text {max }}\right)$ for all $x \in C$. |
| Intermediate Value Theorem (Theorem 3.5.2) | Let $[\mathrm{a}, \mathrm{b}] \subseteq \mathbb{R}$ be a closed bounded interval, and let $\mathrm{f}:[\mathrm{a}, \mathrm{b}] \rightarrow \mathbb{R}$ be a function. Suppose that $f$ is continuous. Let $r \in \mathbb{R}$. If $r$ is strictly between $f(a)$ and $f(b)$, then there is some $c \in(a, b)$ such that $f(c)=$ $r$. We can assume $f(a)<r<f(b)$. |
| Contrapositive for a Proof (Lemma 3.5.3) | Let $F$ be an ordered field. Suppose that F does not satisfy the Least Upper Bound Property. Let A $\subseteq$ F be a non-empty set such that $A$ is bounded above, but $A$ has no least upper bound. Let $a \in$ $A$, and let $b \in F$ be an upper bound of $A$. Let $Q=\{x \in[a, b] \mid x$ is an upper bound of $A\}$ and $P=[a, b]-Q$. <br> 1. $P \cup Q=[a, b]$ and $P \cap Q=\varnothing$. <br> 2. $a<b$, and $A \cap[a, b] \subseteq P$, and $a \in P$, and $b \in Q$. <br> 3. If $x \in P$ and $z \in Q$, then $x<z$. <br> 4. If $x \in P$, then there is some $y \in P$ such that $x<y$. If $z \in Q$, then there is some $w \in Q$ such that $w<z$. <br> 5. The set $P$ does not have a least upper bound, and the set $Q$ does not have a greatest lower bound. |
| Theorem 3.5.4 | The following are equivalent. <br> a1. The Least Upper Bound Property. <br> a2. The Greatest Lower Bound Property. <br> b. The Heine-Borel Theorem. <br> c. The Extreme Value Theorem. <br> d. The Intermediate Value Theorem. |

## Ch. 4.2 The Derivative

| Definition / Theorem / Example | Description |
| :---: | :---: |
| Definition of Derivative with x-c <br> (Definition 4.2.1) | Let $I \subseteq \mathbb{R}$ be an open interval, let $\mathrm{c} \in \mathrm{I}$ and let $\mathrm{f}: \mathrm{I} \rightarrow \mathbb{R}$ be a function. <br> 1. The function $f$ is differentiable at c if $\lim _{x \rightarrow c} \frac{f(x)-f(c)}{x-c}$ <br> exists; if this limit exists, it is called the derivative of $f$ at $c$, and it is denoted $f^{\prime}(c)$. <br> 2. The function $f$ is differentiable if it is differentiable at every number in I. If $f$ is differentiable, the derivative of $f$ is the function $f^{\prime}: I \rightarrow \mathbb{R}$ whose value at $x$ is $f^{\prime}(x)$ for all $x \in I$. |
| Definition of Derivative with h (Lemma 4.2.2) | Let $I \subseteq \mathbb{R}$ be an open interval, let $c \in I$ and let $f: I \rightarrow \mathbb{R}$ be a function. Then $f$ is differentiable at c if and only if $\lim _{h \rightarrow 0} \frac{f(c+h)-f(c)}{h}$ <br> exists, and if this limit exists it equals $f^{\prime}(c)$. |
| Example 4.2.3 | (1) $f(x)=m x+b$ so $(m x+b)^{\prime}=m$. <br> (2) $g(x)=x^{2}$ so $g^{\prime}(x)=2 x$ <br> (3) $k(x)=\|x\|$ so $k^{\prime}(x)$ does not exist unless $x \in(0, \infty)$. |
| Differentiable $\rightarrow$ <br> Continuous <br> (Theorem 4.2.4) | Let $I \subseteq \mathbb{R}$ be an open interval, and let $\mathrm{f}: \mathrm{I} \rightarrow \mathbb{R}$ be a function. Let c $\in \mathrm{I}$. <br> If $f$ is differentiable at $c$, then $f$ is continuous at $c$. <br> If $f$ is differentiable, then $f$ is continuous. |
| Continuous vs. Differentiable <br> (Example 4.2.5) | (1) $f(x)=\left\{x^{2} \sin \left(1 / x^{2}\right)\right.$, if $\left.x \neq 0\right\}$ $\{0, \text { if } x=0\} .$ <br> So, $f^{\prime}$ exists everywhere, but $f^{\prime}$ is not continuous. <br> (2) $\begin{gathered} g(x)=\left\{x^{2}, \text { if } x \geq 0\right\} \\ \left\{-x^{2}, \text { if } x<0\right\} \end{gathered}$ <br> So, $\mathrm{g}^{\prime}$ is continuous, however $\mathrm{g}^{\prime}$ is not differentiable. |

| $\mathrm{n}^{\text {th }}$ Derivatives (Definition 4.2.6) | Let $\mathrm{I} \subseteq \mathbb{R}$ be an open interval, let $\mathrm{c} \in \mathrm{I}$ and let $\mathrm{f}: \mathrm{I} \rightarrow \mathbb{R}$ be a function. <br> Suppose that f is differentiable at c . <br> The function $f$ is twice differentiable at $c$ if $f^{\prime}$ is differentiable at $c$. If $f^{\prime}$ is differentiable at $c$, the derivative $\left(f^{\prime}\right)^{\prime}(c)$ is called the second derivative of $f$ at $c$, and it is denoted $f^{\prime \prime}(c)$. <br> The function f is twice differentiable if it is twice differentiable at every number in I. <br> If $f$ is twice differentiable, the second derivative of $f$ is the function $f^{\prime \prime}: I \rightarrow \mathbb{R}$ whose value at $x$ is $f^{\prime \prime}(x)$ for all $x \in I$. <br> The $\mathrm{n}^{\text {th }}$ derivative of f for all $\mathrm{n} \in \mathbb{N}$ is defined as follows, using Definition by Recursion. <br> If $f$ is differentiable at $c$, the first derivative of $f$ at $c$ is simply the derivative of $f$ at $c$. <br> Suppose that f is $\mathrm{n}-1$ times differentiable at c . <br> The ( $n-1$ )-st derivative of $f$ at $c$ is denoted $f^{(n-1)}(c)$. <br> The function $f$ is $\mathbf{n}$ times differentiable at $c$ if $f^{(n-1)}$ is differentiable at c . <br> If $f^{(n-1)}$ is differentiable at $c$, the derivative $\left(f^{(n-1)}\right)^{\prime}(c)$ is called the $\mathbf{n}^{\text {th }}$ derivative of $f$ at $c$, and it is denoted $f^{(n)}(c)$. <br> The function f is n times differentiable if it is n times differentiable at every number in I . <br> If $f$ is $n$ times differentiable, the $n^{\text {th }}$ derivative of $f$ is the function $f^{(n)}: I \rightarrow \mathbb{R}$ whose value at $x$ is $f^{(n)}(x)$ for all $x \in I$. |
| :---: | :---: |
| Continuously/Infinitely Differentiable <br> (Definition 4.2.7) | Let $\mathrm{I} \subseteq \mathbb{R}$ be an open interval, and let $\mathrm{f}: \mathrm{I} \rightarrow \mathbb{R}$ be a function. <br> The function $f$ is continuously differentiable if $f$ is differentiable and $f^{\prime}$ is continuous. <br> Let $\mathrm{n} \in \mathbb{N}$. The function f is continuously differentiable of order n if $\mathrm{f}^{(\mathrm{i})}$ exists and is continuous for all $\mathrm{i} \in\{1, \ldots, n\}$. <br> The function $f$ is infinitely differentiable (also called smooth) if $f^{(i)}$ exists all $\boldsymbol{i} \in \mathbb{N}$. |

| One-Sided Derivatives (Definition 4.2.8) | Let $\mathrm{I} \subseteq \mathbb{R}$ be a non-degenerate interval, let $\mathrm{c} \in \mathrm{I}$ and let $\mathrm{f}: \mathrm{I} \rightarrow \mathbb{R}$ be a function. <br> 1. Suppose that $c$ is a left endpoint of $I$. The function $f$ is differentiable at c if the limit $\lim _{x \rightarrow c^{+}} \frac{f(x)-f(c)}{x-c}=\lim _{h \rightarrow 0^{+}} \frac{f(c+h)-f(c)}{h}$ <br> exists; if this limit exists, it is called the one-sided derivative of $f$ at $c$, and it is denoted $f^{\prime}(c)$. <br> 2. Suppose that c is a right endpoint of I . The function f is differentiable at c if the limit $\lim _{x \rightarrow c^{-}} \frac{f(x)-f(c)}{x-c}=\lim _{h \rightarrow 0^{-}} \frac{f(c+h)-f(c)}{h}$ <br> exists; if this limit exists, it is called the one-sided derivative of $f$ at $c$, and it is denoted $\mathrm{f}^{\prime}(\mathrm{c})$. <br> 3. The function $f$ is differentiable if the restriction of $f$ to the interior of $I$ is differentiable in the usual sense, and if $f$ is differentiable at the endpoints of $I$ in the sense of Parts (1) and (2) of this definition if there are endpoints. |
| :---: | :---: |
| Symmetric Derivative <br> (Exercise 4.2.7) | Let $\mathrm{I} \subseteq \mathbb{R}$ be an open interval, let $\mathrm{c} \in \mathrm{I}$ and let $\mathrm{f}: \mathrm{I} \rightarrow \mathbb{R}$ be a function. The function $f$ is symmetrically differentiable at $c$ if $\lim _{h \rightarrow 0} \frac{f(c+h)-f(c-h)}{2 h}$ <br> exists; if this limit exists, it is called the symmetric derivative of $f$ at c . |

## Ch. 4.3 Computing Derivatives

| Theorem / Corollary | Description |
| :---: | :---: |
| Derivatives: $+,-, \bullet, \div$ <br> (Theorem 4.3.1) | Let $\mathrm{I} \subseteq \mathbb{R}$ be an open interval, let $\mathrm{c} \in \mathrm{I}$, let $\mathrm{f}, \mathrm{g}: \mathrm{I} \rightarrow \mathbb{R}$ be functions and let $k \in \mathbb{R}$. Suppose that $f$ and $g$ are differentiable at $c$. <br> 1. $\mathrm{f}+\mathrm{g}$ is differentiable at c and $[\mathrm{f}+\mathrm{g}]^{\prime}(\mathrm{c})=\mathrm{f}^{\prime}(\mathrm{c})+\mathrm{g}^{\prime}(\mathrm{c})$. <br> 2. $\mathbf{f}-\mathrm{g}$ is differentiable at c and $[\mathrm{f}-\mathrm{g}]^{\prime}(\mathrm{c})=\mathrm{f}^{\prime}(\mathrm{c})-\mathrm{g}^{\prime}(\mathrm{c})$. <br> 3. $\mathbf{k f}$ is differentiable at c and $[\mathrm{kf}]^{\prime}(\mathrm{c})=\mathrm{kf} \mathrm{f}^{\prime}(\mathrm{c})$. <br> 4. (Product Rule) fg is differentiable at c and $[\mathrm{fg}]^{\prime}(\mathrm{c})=\mathrm{f}^{\prime}(\mathrm{c}) \mathrm{g}(\mathrm{c})+$ $\mathrm{f}(\mathrm{c}) \mathrm{g}^{\prime}(\mathrm{c})$. <br> 5. (Quotient Rule) If $\mathrm{g}(\mathrm{c}) \neq 0$, then $\mathrm{f} / \mathrm{g}$ is differentiable at c and $\left[\frac{f}{g}\right]^{\prime}(c)=\frac{f^{\prime}(c) g(c)-f(c) g^{\prime}(c)}{[g(c)]^{2}}$ |
| Entire Function (Corollary 4.3.2) | Let $\mathrm{I} \subseteq \mathbb{R}$ be an open interval, let $\mathrm{f}, \mathrm{g}: \mathrm{I} \rightarrow \mathbb{R}$ be functions and let k $\in \mathbb{R}$. If $f$ and $g$ are differentiable, then $f+g, f-g$, $k f$ and $f g$ are differentiable, and if $\mathrm{g}(\mathrm{x}) \neq 0$ for all $\mathrm{x} \in \mathrm{I}$ then $\mathrm{f} / \mathrm{g}$ is differentiable. |
| Chain Rule <br> (Theorem 4.3.3) | Let $\mathrm{I}, \mathrm{J} \subseteq \mathbb{R}$ be open intervals, let $\mathrm{c} \in \mathrm{I}$ and let $\mathrm{f}: \mathrm{I} \rightarrow \mathrm{J}$ and $\mathrm{g}: \mathrm{J} \rightarrow \mathbb{R}$ be functions. Suppose that $f$ is differentiable at c , and that g is differentiable at $\mathrm{f}(\mathrm{c})$. Then $\mathrm{g} \circ \mathrm{f}$ is differentiable at c and $[\mathrm{g} \circ \mathrm{f}]^{\prime}(\mathrm{c})=$ $\mathrm{g}^{\prime}(\mathrm{f}(\mathrm{c})) \cdot \mathrm{f}^{\prime}(\mathrm{c})$. |
| Chain Rule Differentiable (Corollary 4.3.4) | Let $\mathrm{I}, \mathrm{J} \subseteq \mathbb{R}$ be open intervals, and let $\mathrm{f}: \mathrm{I} \rightarrow \mathrm{J}$ and $\mathrm{g}: \mathrm{J} \rightarrow \mathbb{R}$ be functions. If $f$ and $g$ are differentiable, then $g \circ f$ is differentiable. |

## Ch. 4.4 The Mean Value Theorem

| Axiom / Theorem / Lemma / Definition | Description |
| :---: | :---: |
| Min/Max at a Point, $f^{\prime}(c)=$ 0 (Lemma 4.4.1) | Let $[\mathrm{a}, \mathrm{b}] \subseteq \mathbb{R}$ be a non-degenerate closed bounded interval, let $\mathrm{c} \in$ $(\mathrm{a}, \mathrm{b})$ and let $\mathrm{f}:[\mathrm{a}, \mathrm{b}] \rightarrow \mathbb{R}$ be a function. <br> Suppose that $f$ is differentiable at $c$. <br> If either $f(c) \geq f(x)$ for all $x \in[a, b]$ or $f(c) \leq f(x)$ for all $x \in[a, b]$, then $f^{\prime}(c)=0$. |
| $f^{\prime}(c)=0$, But Not a Min/Max <br> (Example 4.4.2) | Let $\mathrm{f}:[-1,1] \rightarrow \mathbb{R}$ be defined by $\mathrm{f}(\mathrm{x})=\mathrm{x}^{3}$ for all $\mathrm{x} \in[-1,1]$. It can be verified using the definition of derivatives that $f^{\prime}(0)=0$; the details are left to the reader. On the other hand, it is certainly not the case that $f(0) \geq f(x)$ for all $x \in[-1,1]$, or that $f(0) \leq f(x)$ for all $x \in$ [-1,1]. |
| Rolle's Theorem: $f(a)=f(b)$ (Lemma 4.4.3) | Let $[\mathrm{a}, \mathrm{b}] \subseteq \mathbb{R}$ be a non-degenerate closed bounded interval, and let $\mathrm{f}:[\mathrm{a}, \mathrm{b}] \rightarrow \mathbb{R}$ be a function. <br> Suppose that f is continuous on $[\mathrm{a}, \mathrm{b}]$ and differentiable on ( $\mathrm{a}, \mathrm{b}$ ). If $f(a)=f(b)$, then there is some $c \in(a, b)$ such that $f^{\prime}(c)=0$. <br> Note: Rolle's Theorem is a special case of the Mean Value Theorem where $f(a)=f(b)$. |

| Mean Value Theorem (Average Slope) <br> (Theorem 4.4.4) | Let $[\mathrm{a}, \mathrm{b}] \subseteq \mathbb{R}$ be a non-degenerate closed bounded interval, and let $\mathrm{f}:[\mathrm{a}, \mathrm{b}] \rightarrow \mathbb{R}$ be a function. <br> Suppose that $f$ is continuous on $[a, b]$ and differentiable on $(a, b)$. Then there is some $c \in(a, b)$ such that $f^{\prime}(c)=\frac{f(b)-f(a)}{b-a}$  $f^{\prime}\left(\xi_{1}\right)=\frac{f(b)-f(a)}{b-a}$ <br> Note: The Mean Value Theorem is a special case of Cauchy's Mean Value Theorem where $g(x)=x$. <br> Note: The Mean Value Theorem is a special case of Taylor's Theorem where $\mathrm{n}=0, \mathrm{c}=\mathrm{a}$, and $\mathrm{x}=\mathrm{b}$ |
| :---: | :---: |

| Cauchy's Mean Value <br> Theorem <br> (Theorem 4.4.5) | Let $[\mathrm{a}, \mathrm{b}] \subseteq \mathbb{R}$ be a non-degenerate closed bounded interval, and let $\mathrm{f}, \mathrm{g}:[\mathrm{a}, \mathrm{b}] \rightarrow \mathbb{R}$ be functions. <br> Suppose that $f$ and $g$ are continuous on $[\mathrm{a}, \mathrm{b}]$ and differentiable on ( $\mathrm{a}, \mathrm{b}$ ). <br> Then there is some $\mathrm{c} \in(\mathrm{a}, \mathrm{b})$ such that $[f(b)-f(a)] g^{\prime}(c)=[g(b)-g(a)] f^{\prime}(c)$ |
| :---: | :---: |
| Cauchy $\rightarrow$ Mean Value Theorem | The Mean Value Theorem is the special case of Cauchy's Mean Value Theorem (Theorem 4.4.5) where the function $g$ is defined by $\mathrm{g}(\mathrm{x})=\mathrm{x}$ for all $\mathrm{x} \in[\mathrm{a}, \mathrm{b}]$. |
| Taylor's Theorem (Theorem 4.4.6) | Let $[\mathrm{a}, \mathrm{b}] \subseteq \mathbb{R}$ be a non-degenerate closed bounded interval, let $\mathrm{c} \in$ $(\mathrm{a}, \mathrm{b})$, let $\mathrm{f}:[\mathrm{a}, \mathrm{b}] \rightarrow \mathbb{R}$ be a function and let $\mathrm{n} \in \mathbb{N} \cup\{0\}$. <br> Suppose that $f^{(k)}$ exists and is continuous on $[a, b]$ for each $k \in\{0$, $\ldots, n\}$, and that $f^{(n+1)}$ exists on (a,b). <br> Let $\mathrm{x} \in[\mathrm{a}, \mathrm{b}]$. <br> Then there is some $p$ strictly between $x$ and $c$ (except that $p=c$ when $\mathrm{x}=\mathrm{c}$ ) such that $f(x)=\sum_{k=0}^{n} \frac{f^{(k)}(c)}{k!}(x-c)^{k}+\frac{f^{(k+1)}(p)}{(n+1)!}(x-c)^{n+1}$ |
| Parallel Functions (Lemma 4.4.7) | Let $\mathrm{I} \subseteq \mathbb{R}$ be a non-degenerate interval, and let $\mathrm{f}, \mathrm{g}: \mathrm{I} \rightarrow \mathbb{R}$ be function. <br> Suppose that $f$ and $g$ are continuous on I and differentiable on the interior of $I$. <br> 1. $f^{\prime}(x)=0$ for all $x$ in the interior of $I$ if and only if $f$ is constant on $I$. <br> 2. $f^{\prime}(x)=g^{\prime}(x)$ for all $x$ in the interior of $I$ if and only if there is some $C \in \mathbb{R}$ such that $f(x)=g(x)+C$ for all $x \in I$. |
| Antiderivative ( $\mathrm{F}^{\prime}=\mathrm{f}$ ) (Definition 4.4.8) | Let $I \subseteq \mathbb{R}$ be an open interval, and let $f: I \rightarrow \mathbb{R}$ be a function. <br> An antiderivative of $f$ is a function $F: I \rightarrow \mathbb{R}$ such that $F$ is differentiable and $\mathrm{F}^{\prime}=\mathrm{f}$. |

| Constant of Integration (+ <br> C) <br> (Corollary 4.4.9) | Let $\mathrm{I} \subseteq \mathbb{R}$ be a non-degenerate open interval, and let $\mathrm{f}: \mathrm{I} \rightarrow \mathbb{R}$ be a function. <br> If $\mathrm{F}, \mathrm{G}: \mathrm{I} \rightarrow \mathbb{R}$ are antiderivatives of f , then there is some $\mathrm{C} \in \mathbb{R}$ such that $\mathrm{F}(\mathrm{x})=\mathrm{G}(\mathrm{x})+\mathrm{C}$ for all $\mathrm{x} \in \mathrm{I}$. |
| :---: | :---: |
| Intermediate Value <br> Theorem for Derivatives <br> (Theorem 4.4.10) | Let $\mathrm{I} \subseteq \mathbb{R}$ be an open interval, and let $\mathrm{f}: \mathrm{I} \rightarrow \mathbb{R}$ be a function. <br> Suppose that $f$ is differentiable. <br> Let $\mathrm{a}, \mathrm{b} \in \mathrm{I}$, and suppose that $\mathrm{a}<\mathrm{b}$. <br> Let $r \in \mathbb{R}$. <br> If $r$ is strictly between $f^{\prime}(a)$ and $f^{\prime}(b)$, then there is some $c \in(a, b)$ such that $\mathrm{f}^{\prime}(\mathrm{c})=\mathrm{r}$. |
| $\begin{aligned} & g(x) \neq f^{\prime}(x) \\ & \text { (Example 4.4.11) } \end{aligned}$ | Let $\mathrm{g}: \mathbb{R} \rightarrow \mathbb{R}$ be defined by $g(x)= \begin{cases}1, & \text { if } x \leq 1 \\ 2, & \text { if } x>1\end{cases}$ <br> Then g is not the derivative of any function, because it does not satisfy the conclusion of the Intermediate Value Theorem for Derivatives (Theorem 4.4.10). |

## Ch. 4.5 Increasing and Decreasing Functions, Part I: Local and Global Extrema

| Axiom / Theorem / Lemma / Definition | Description |
| :---: | :---: |
| $\mathrm{f}(\mathrm{x})$ vs. Increasing / Decreasing / Monotone (Definition 4.5.1) | Let $\mathrm{A} \subseteq \mathbb{R}$ be a set, and let $\mathrm{f}: \mathrm{A} \rightarrow \mathbb{R}$ be a function. <br> 1. The function $f$ is increasing if $x<y$ implies $f(x) \leq f(y)$ for all $x, y \in$ A. <br> 2. The function $f$ is strictly increasing if $x<y$ implies $f(x)<f(y)$ for all $x, y \in A$. <br> 3. The function $f$ is decreasing if $x<y$ implies $f(x) \geq f(y)$ for all $x, y \in$ A. <br> 4. The function $f$ is strictly decreasing if $x<y$ implies $f(x)>f(y)$ for all $x, y \in A$. <br> 5. The function $f$ is monotone if it is either increasing or decreasing. <br> 6. The function $f$ is strictly monotone if it is either strictly increasing or strictly decreasing. |
| $f^{\prime}(x)$ vs. Increasing (Theorem 4.5.2) | Let $\mathrm{I} \subseteq \mathbb{R}$ be a non-degenerate interval, and let $\mathrm{f}: \mathrm{I} \rightarrow \mathbb{R}$ be a function. Suppose that $f$ is continuous on $I$ and differentiable on the interior of I. <br> 1. $f^{\prime}(x) \geq 0$ for all $x$ in the interior of $I$ if and only if $f$ is increasing on I. <br> 2. If $f^{\prime}(x)>0$ for all $x$ in the interior of $I$, then $f$ is strictly increasing on I. <br> 3. $f^{\prime}(x) \leq 0$ for all $x$ in the interior of $I$ if and only if $f$ is decreasing on I. <br> 4. If $f^{\prime}(x)<0$ for all $x$ in the interior of $I$, then $f$ is strictly decreasing on I. |
| Example 4.5.3 | Let $\mathrm{f}: \mathbb{R} \rightarrow \mathbb{R}$ be defined by $\mathrm{f}(\mathrm{x})=\mathrm{x}^{3}$ for all $\mathrm{x} \in \mathbb{R}$. <br> The function $f$ is strictly increasing, as seen by Exercise 2.3.3 (1); that exercise does not make use of derivatives. <br> However, we know by Exercise 4.3.5 that $\mathrm{f}^{\prime}(\mathrm{x})=3 \mathrm{x}^{2}$ for all $\mathrm{x} \in \mathbb{R}$, and hence $f^{\prime}(0)=0$. <br> Therefore Theorem 4.5.2 (2) cannot be made into an "if and only if" statement. <br> A similar example shows that Theorem 4.5.2 (4) cannot be made into an "if and only if" statement. |

\(\left.$$
\begin{array}{|l|l|}\hline & \begin{array}{l}\text { Let } A \subseteq \mathbb{R} \text { be a set, let } c \in A \text { and let } f: A \rightarrow \mathbb{R} \text { be a function. } \\
\text { 1. The number } c \text { is a local maximum of } f \text { if there is some } \delta>0 \text { such } \\
\text { that } x \in A \text { and }|x-c|<\delta \text { imply } f(x) \leq f(c) .\end{array}
$$ <br>
2. The number c is a local minimum of f if there is some \delta>0 such <br>

that x \in A and|x-c|<\delta imply f(x) \geq f(c) .\end{array}\right\}\)| 2. The number $c$ is a local extremum of $f$ if it is either a local |
| :--- |
| (Daximum or a local minimum. |
| 4. The number $c$ is a global maximum of $f$ if $f(x) \leq f(c)$ for all $x \in A$. |
| 5. The number $c$ is a global minimum of $f$ if $f(x) \geq f(c)$ for all $x \in A$. |
| 6. The number $c$ is a global extremum of $f$ if it is either a global |
| maximum or a global minimum. |

| Second Derivative Test (Theorem 4.5.10) | Let $I \subseteq \mathbb{R}$ be an open interval, let $c \in I$ and let $f: I \rightarrow \mathbb{R}$ be a function. Suppose that $f$ is differentiable, that $f^{\prime}(c)=0$ and that $f$ is twice differentiable at c . <br> 1. If $f^{\prime \prime}(c)>0$, then $c$ is a local minimum of $f$. <br> 2. If $f^{\prime}(c)<0$, then $c$ is a local maximum of $f$. |
| :---: | :---: |
| Example 4.5.11 | (1) Let $\mathrm{f}, \mathrm{g}: \mathbb{R} \rightarrow \mathbb{R}$ be defined by $f(x)=x^{3}$ and $g(x)=x^{4}$ for all $x \in \mathbb{R}$. It is straightforward to verify that $\mathrm{f}^{\prime}(0)=0$ and $\mathrm{g}^{\prime}(0)=0$, and that $\mathrm{f}^{\prime \prime}(0)=0$ and $\mathrm{g}^{\prime}(0)=0$. <br> Because $x^{4}=\left(x^{2}\right)^{2} \geq 0$ for all $x \in \mathbb{R}$, then 0 is a local (and also global) minimum of $g$. <br> As noted in Example 4.5.8, the number 0 is not a local extremum of $f$. |
|  | (2) Let $\mathrm{k}: \mathbb{R} \rightarrow \mathbb{R}$ be defined by $k(x)=\|x\|$ for all $x \in \mathbb{R}$. <br> We saw in Example 4.2.3 (3) that $k$ is not differentiable at 0 , and hence 0 is a critical point of $k$. <br> We also saw that $k^{\prime}(x)=-1$ for all $x \in(-\infty, 0)$, and $k^{\prime}(x)=1$ for all $x$ $\in(0, \infty)$. <br> Because k is not differentiable at 0 , we cannot apply the Second Derivative Test (Theorem 4.5.10) to k at 0 . <br> However, the First Derivative Test (Theorem 4.5.9) can still be applied, and we see that 0 is a local minimum of $k$, which is just what we would expect by looking at the graph of $k$. |
| Local $\rightarrow$ Global <br> (Theorem 4.5.12) | Let $I \subseteq \mathbb{R}$ be an open interval, let $c \in I$ and let $f: I \rightarrow \mathbb{R}$ be a function. Suppose that $f$ is continuous, and that c is the only critical point of $f$. <br> 1. If c is a local maximum, then it is a global maximum. <br> 2. If c is a local minimum, then it is a global minimum. |

## Ch. 4.6 Increasing and Decreasing Functions, Part II: Further Topics

| Axiom / Theorem / <br> Lemma / Definition | Description |
| :---: | :---: |
| Not Differentiable (Example 4.6.1) | Let $f: \mathbb{R} \rightarrow \mathbb{R}$ be defined by $f(x)=x^{3}$ for all $x \in \mathbb{R}$. <br> Intuitively, we know that the function f is bijective, and hence it has an inverse function $\mathrm{f}^{-1}: \mathbb{R} \rightarrow \mathbb{R}$, which we write as $\mathrm{f}^{-1}(\mathrm{x})=\sqrt[3]{x}$ for all $\mathrm{x} \in \mathbb{R}$. <br> Moreover, we know that the graph of $f^{-1}$ is obtained from the graph of $f$ by reflection in the line $y=x$. <br> Because $f$ has a horizontal tangent line at the origin, then the graph of $f^{-1}$ has a vertical tangent line at $x=0$, which makes it not differentiable at $x=0$. |
| Bounded Intervals (Lemma 4.6.2) | Let $\mathrm{I} \subseteq \mathbb{R}$ be a non-degenerate open interval, and let $\mathrm{f}: \mathrm{I} \rightarrow \mathbb{R}$ be a function. Suppose that $f$ is strictly monotone. <br> 1. The function $\mathrm{f}: \mathrm{I} \rightarrow \mathrm{f}(\mathrm{I})$ is bijective. <br> 2. Suppose that $f$ is continuous. Then $f(I)$ is a non-degenerate open interval, and one of the following holds: <br> a. If the interval $f(I)$ is bounded, then $f(I)=(g l b f(I)$, lub $f(I))$. <br> b. If the interval $f(I)$ is bounded above but is not bounded below, then $f(I)=(-\infty$, lub $f(I))$. <br> c. If the interval $f(I)$ is bounded below but is not bounded above, then $f(I)=(g l b f(I), \infty)$. <br> d. If the interval $f(1)$ is not bounded above and is not bounded below, then $f(I)=\mathbb{R}$. |
| Example 4.6.3 | We want to show that the square root function is continuous. Let $\mathrm{f}:(0, \infty) \rightarrow \mathbb{R}$ be defined by $\mathrm{f}(\mathrm{x})=\mathrm{x}^{2}$ for all $\mathrm{x} \in \mathbb{R}$. <br> By Exercise 3.5.6 (1) we see that $f$ is strictly increasing, and by Example 3.3.7 (1) we see that $f$ is continuous. <br> Exercise 3.5.6 implies that $f((0, \infty))=(0, \infty)$. <br> It then follows from Lemma 4.6.2 (3) that $\mathrm{f}^{-1}:(0, \infty) \rightarrow(0, \infty)$ is continuous and strictly increasing. <br> By Definition 2.6.10 we see that $\mathrm{f}^{-1}(\mathrm{x})=\sqrt[2]{x}$ for all $\mathrm{x} \in(0, \infty)$. <br> The continuity of this function could also be shown directly by an <br> $\varepsilon-\delta$ proof, but Lemma 4.6.2 allows us to avoid that. |
| Inverse Derivatives (Theorem 4.6.4) | Let $\mathrm{I} \subseteq \mathbb{R}$ be a non-degenerate open interval, and let $\mathrm{f}: \mathrm{I} \rightarrow \mathbb{R}$ be a function. Suppose that $f$ is differentiable, and that $f^{\prime}(x) \neq 0$ for all $x$ $\in I$. <br> 1. The function $f$ is strictly monotone. <br> 2. The function $\mathrm{f}: \mathrm{I} \rightarrow \mathrm{f}(\mathrm{I})$ is bijective. <br> 3. The function $f^{-1}: f(I) \rightarrow I$ is differentiable. <br> 4. The derivative of $f^{-1}$ is given by $\left[f^{-1}\right]^{\prime}(x)=\frac{1}{f^{\prime}\left(f^{-1}(x)\right)}$ <br> for all $x \in f(I)$. |

| Secant Line (Definition 4.6.5) | Let $\mathrm{I} \subseteq \mathbb{R}$ be an open interval, let $\mathrm{a}, \mathrm{b} \in \mathrm{I}$ and let $\mathrm{f}: \mathrm{I} \rightarrow \mathbb{R}$ be a function. Suppose that $\mathrm{a}<\mathrm{b}$. <br> The secant line through ( $a, f(a)$ ) and $(b, f(b))$ is the function $S_{a, b}: \mathbb{R}$ <br> $\rightarrow \mathbb{R}$ defined by $S_{a, b}(x)=f(a) \frac{b-x}{b-a}+f(b) \frac{x-a}{b-a}$ <br> for all $\mathrm{x} \in \mathbb{R}$. <br> The slope of the secant line through ( $a, f(a)$ ) and ( $b, f(b)$ ), denoted $M_{a, b}$, is defined by $M_{a, b}=\frac{f(b)-f(a)}{b-a}$ |
| :---: | :---: |
| Function vs Secant Line (Theorem 4.6.6) | Let $\mathrm{I} \subseteq \mathbb{R}$ be an open interval, and let $\mathrm{f}: \mathrm{I} \rightarrow \mathbb{R}$ be a function. The following are equivalent. <br> a. If $\mathrm{a}, \mathrm{b} \in \mathrm{I}$ and $\mathrm{a}<\mathrm{b}$, then $\mathrm{f}(\mathrm{x}) \leq \mathrm{S}_{\mathrm{a}, \mathrm{b}}(\mathrm{x})$ for all $\mathrm{x} \in[\mathrm{a}, \mathrm{b}]$ <br> (Function Lies Below Its Secant Lines). <br> b. If $\mathrm{a}, \mathrm{b}, \mathrm{c} \in \mathrm{I}$ and $\mathrm{a}<\mathrm{b}<\mathrm{c}$, then $\mathrm{M}_{\mathrm{a}, \mathrm{b}} \leq \mathrm{M}_{\mathrm{b}, \mathrm{c}}$ <br> (Function Has Increasing Secant Line Slopes). |
| Concave Up <br> (Definition 4.6.7) | Let $I \subseteq \mathbb{R}$ be an open interval, and let $f: I \rightarrow \mathbb{R}$ be a function. The function $f$ is concave up if either of the two conditions in Theorem 4.6.6 hold. |
| Theorem 4.6.8 | Let $\mathrm{I} \subseteq \mathbb{R}$ be an open interval, and let $\mathrm{f}: \mathrm{I} \rightarrow \mathbb{R}$ be a function. <br> 1. Suppose that $f$ is differentiable. Then the two conditions in Theorem 4.6 .6 hold if and only if $f^{\prime}$ is increasing on I. <br> 2. Suppose that f is twice differentiable. Then the two conditions in Theorem 4.6 .6 hold if and only if $f^{\prime \prime}(x) \geq 0$ for all $x \in I$. |

## Ch. 5.2 The Riemann Integral

| Axiom / Theorem / Lemma / Definition | Description |
| :---: | :---: |
| Definition 5.2.1 | Let $[\mathrm{a}, \mathrm{b}] \subseteq \mathbb{R}$ be a non-degenerate closed bounded interval. <br> 1. A partition of $[a, b]$ is a set $P=\left\{x_{0}, x_{1}, \ldots, x_{n}\right\}$ such that $a=x_{0}<x_{1}$ $<\cdots<x_{n}=b$, for some $n \in \mathbb{N}$. <br> 2. If $P=\left\{x_{0}, x_{1}, \ldots, x_{n}\right\}$ is a partition of $[a, b]$, the norm (also called the mesh) of $P$, denoted $\\|P\\|$, is defined by $\\|P\\|=\max \left\{x_{1}-x_{0}, x_{2}-x_{1}, \ldots, x_{n}-x_{n-1}\right\} .$ <br> 3. If $P=\left\{x_{0}, x_{1}, \ldots, x_{n}\right\}$ is a partition of $[a, b]$, a representative set of $P$ is a set $T=\left\{t_{1}, t_{2}, \ldots, t_{n}\right\}$ such that $t_{i} \in\left[x_{i-1}, x_{i}\right]$ for all $i \in\{1, \ldots, n\}$. |
| Riemann Sum (Definition 5.2.2) | Let $[\mathrm{a}, \mathrm{b}] \subseteq \mathbb{R}$ be a non-degenerate closed bounded interval, let f : $[a, b] \rightarrow \mathbb{R}$ be a function, let $P=\left\{x_{0}, x_{1}, \ldots, x_{n}\right\}$ be a partition of $[a, b]$ and let $T=\left\{\mathrm{t}_{1}, \mathrm{t}_{2}, \ldots, \mathrm{t}_{n}\right\}$ be a representative set of P . The Riemann sum of $f$ with respect to $P$ and $T$, denoted $S(f, P, T)$, is defined by $S(f, P, T)=\sum_{i=1}^{n} f\left(t_{i}\right)\left(x_{i}-x_{i-1}\right)$  |
| Example 5.2.3 | (1) $f(x)=x^{2}$ |
|  | (2) $\mathrm{r}(\mathrm{x})=\{1$ or 0$\}$ |
| Definition of Integrability ( $\varepsilon$ - $\delta$ ) <br> (Definition 5.2.4) | Let $[\mathrm{a}, \mathrm{b}] \subseteq \mathbb{R}$ be a non-degenerate closed bounded interval, let f : $[a, b] \rightarrow \mathbb{R}$ be a function and let $K \in \mathbb{R}$. The number $K$ is the <br> Riemann integral of $f$, written $\int_{a}^{b} f(x) d x=K$ <br> if for each $\varepsilon>0$, there is some $\delta>0$ such that if P is a partition of $[a, b]$ with $\\|P\\|<\delta$, and if $T$ is a representative set of $P$, then $\|S(f, P, T)-K\|<\varepsilon$. If the Riemann integral of $f$ exists, we say that $f$ is Riemann integrable. |

| Unique K (Lemma 5.2.5) | Let $[\mathrm{a}, \mathrm{b}] \subseteq \mathbb{R}$ be a non-degenerate closed bounded interval, and let $\mathrm{f}:[\mathrm{a}, \mathrm{b}] \rightarrow \mathbb{R}$ be a function. <br> If $f$ is Riemann integrable, then there is a unique $K \in \mathbb{R}$ such that $\int_{a}^{b} f(x) d x=K$ |
| :---: | :---: |
| Example 5.2.6 | (1) $f(x)=c$ |
|  | (2) $g(x)=\{7$ or 0$\}$ |
|  | (3) $r(x)=\{0$ or 1$\}$ |
|  | (4) $s(x)=\{1 / q$ or 0$\}$ |
|  | (5) $\mathrm{v}(\mathrm{x})=\{0$ or 1$\}$ |
| Exercise 5.2.1 | Let $[\mathrm{a}, \mathrm{b}] \subseteq \mathbb{R}$ be a non-degenerate closed bounded interval, and let $\varepsilon>0$. Prove that there is a partition $R$ of $[a, b]$ such that $\|\mid R \\|<$ $\varepsilon$. |

## Ch. 5.3 Elementary Properties of the Reimann Integral

| Axiom / Theorem / Lemma / Definition | Description |
| :---: | :---: |
| Integration: +, -, k <br> (Theorem 5.3.1) | Let $[\mathrm{a}, \mathrm{b}] \subseteq \mathbb{R}$ be a non-degenerate closed bounded interval, let $\mathrm{f}, \mathrm{g}$ : $[a, b] \rightarrow \mathbb{R}$ be functions and let $k \in \mathbb{R}$. Suppose that $f$ and $g$ are integrable. <br> 1. $\mathrm{f}+\mathrm{g}$ is integrable and $\int_{a}^{b}[f+g](x) d x=\int_{a}^{b} f(x) d x+\int_{a}^{b} g(x) d x$ <br> 2. $\mathrm{f}-\mathrm{g}$ is integrable and $\int_{a}^{b}[f-g](x) d x=\int_{a}^{b} f(x) d x-\int_{a}^{b} g(x) d x$ <br> 3. $k \cdot f$ is integrable and $\int_{a}^{b}[k f](x) d x=k \int_{a}^{b} f(x) d x$ <br> 4. $\int_{a}^{b} k d x=k(b-a)$. |
| Theorem 5.3.2 | Let $[\mathrm{a}, \mathrm{b}] \subseteq \mathbb{R}$ be a closed bounded interval, and let $\mathrm{f}, \mathrm{g}:[\mathrm{a}, \mathrm{b}] \rightarrow \mathbb{R}$ be functions. Suppose that f and g are integrable. <br> 1. If $\mathrm{f}(\mathrm{x}) \geq 0$ for all $\mathrm{x} \in[\mathrm{a}, \mathrm{b}]$, then $\int_{a}^{b} f(x) d x \geq 0$. <br> 2. If $\mathrm{f}(\mathrm{x}) \geq \mathrm{g}(\mathrm{x})$ for all $\mathrm{x} \in[\mathrm{a}, \mathrm{b}]$, then $\int_{a}^{b} f(x) d x \geq \int_{a}^{b} g(x) d x$. <br> 3. Let $\mathrm{m}, \mathrm{M} \in \mathbb{R}$. If $\mathrm{m} \leq \mathrm{f}(\mathrm{x})$ for all $\mathrm{x} \in[\mathrm{a}, \mathrm{b}]$, then $\mathrm{m}(\mathrm{b}-\mathrm{a}) \leq$ $\int_{a}^{b} f(x) d x$, and if $\mathrm{f}(\mathrm{x}) \leq \mathrm{M}$ for all $\mathrm{x} \in[\mathrm{a}, \mathrm{b}]$, then $\int_{a}^{b} f(x) d x \leq$ $M(b-a)$. |
| Integrable $\rightarrow$ Bounded <br> (Theorem 5.3.3) | Let $[\mathrm{a}, \mathrm{b}] \subseteq \mathbb{R}$ be a non-degenerate closed bounded interval, and let $f:[a, b] \rightarrow \mathbb{R}$ be a function. If $f$ is integrable, then $f$ is bounded. |

## Ch. 5.4 Upper Sums and Lower Sums

## Axiom / Theorem / <br> Lemma / Definition

## Description

| Refinement |  |
| :--- | :--- |
| (Definition 5.4.1) | Let $[a, b] \subseteq \mathbb{R}$ be a non-degenerate closed bounded interval, and <br> let $P$ and $Q$ be partitions of $[a, b]$. The partition $Q$ is a refinement of <br>  <br> $P$ if $P \subseteq Q$. |
| Example 5.4.2 | The sets $P=\{0,1 / 2,1\}$, and $Q=\{0,1 / 4,1 / 2,3 / 4,1\}$ and $\mathbb{R}=\{0,1 / 3,2 / 3$, |
| $1\}$ are partitions of $[0,1]$. Then $Q$ is a refinement of $P$, but $\mathbb{R}$ is not $a$ |  |
| refinement of $P$. |  |

| Upper/Lower Sums (Definition 5.4.4) | Let $[\mathrm{a}, \mathrm{b}] \subseteq \mathbb{R}$ be a non-degenerate closed bounded interval, let f : $[a, b] \rightarrow \mathbb{R}$ be a function and let $P=\left\{x_{0}, x_{1}, \ldots, x_{n}\right\}$ be a partition of $[a, b]$. Suppose that $f$ is bounded. <br> 1. For each $i \in\{1, \ldots, n\}$, let $M_{i}(f)=\operatorname{lub} f\left(\left[x_{i-1}, x_{i}\right]\right)$ and $m_{i}(f)=g l b$ $\mathrm{f}\left(\left[\mathrm{X}_{\mathrm{i}-1}, \mathrm{x}_{\mathrm{i}}\right]\right)$. If it is necessary to indicate the partition being used, we will write $M_{i}^{P}(f)$ and $m_{i}^{P}(f)$. <br> 2. The upper sum of $f$ with respect to $P$, denoted $U(f, P)$, is defined by $U(f, P)=\sum_{i=1}^{n} M_{i}(f)\left(x_{i}-x_{i-1}\right)$ <br> and the lower sum of $f$ with respect to $P$, denoted $L(f, P)=\sum_{i=1}^{n} m_{i}(f)\left(x_{i}-x_{i-1}\right)$ <br> NOTE: An upper sum of a continuous function, $f$, takes a point $c_{i}$ in each subinterval where the maximum value of $f$ is achieved. A lower sum takes the minimum value of $f$ for each subinterval. |
| :---: | :---: |
| Example 5.4.5 | (1) $f(x)=x^{2}$ |
|  | (2) $g(x)=\{7$ or 0$\}$ |
|  | (3) $\mathrm{r}(\mathrm{x})=\{1$ or 0$\}$ |

| Lemma 5.4.6 | Let $[\mathrm{a}, \mathrm{b}] \subseteq \mathbb{R}$ be a non-degenerate closed bounded interval, let f : $[\mathrm{a}, \mathrm{b}] \rightarrow \mathbb{R}$ be a function and let P be a partition of $[\mathrm{a}, \mathrm{b}]$. Suppose that $f$ is bounded. <br> 1. If $T$ is a representative set of $P$, then $L(f, P) \leq S(f, P, T) \leq U(f, P)$. <br> 2. If $\mathbb{R}$ is a refinement of $P$, then $L(f, P) \leq L(f, \mathbb{R}) \leq U(f, \mathbb{R}) \leq U(f, P)$. <br> 3. If $Q$ is a partition of $[a, b]$, then $L(f, P) \leq U(f, Q)$. |
| :---: | :---: |
| Integrable Equivalents (Theorem 5.4.7) | Let $[\mathrm{a}, \mathrm{b}] \subseteq \mathbb{R}$ be a non-degenerate closed bounded interval, and let $\mathrm{f}:[\mathrm{a}, \mathrm{b}] \rightarrow \mathbb{R}$ be a function. Suppose that f is bounded. The following are equivalent. <br> a. The function $f$ is integrable. <br> b. For each $\varepsilon>0$, there is some $\delta>0$ such that if P is a partition of $[\mathrm{a}, \mathrm{b}]$ with $\\|\mathrm{P}\\|<\delta$, then $\mathrm{U}(\mathrm{f}, \mathrm{P})-\mathrm{L}(\mathrm{f}, \mathrm{P})<\varepsilon$. <br> c. For each $\varepsilon>0$, there is some partition $P$ of $[a, b]$ such that $\mathrm{U}(\mathrm{f}, \mathrm{P})-\mathrm{L}(\mathrm{f}, \mathrm{P})<\varepsilon$. |
| Upper/Lower Integral (Definition 5.4.8) | Let $[\mathrm{a}, \mathrm{b}] \subseteq \mathbb{R}$ be a non-degenerate closed bounded interval, and let $\mathrm{f}:[\mathrm{a}, \mathrm{b}] \rightarrow \mathbb{R}$ be a function. Suppose that f is bounded. <br> The upper integral of f , denoted $\overline{\int_{a}^{b}} f(x) d x$, is defined by $\overline{\int_{a}^{b}} f(x) d x=\operatorname{glb}\{\mathrm{U}(\mathrm{f}, \mathrm{P}) \mid \mathrm{P}$ is a partition of $[\mathrm{a}, \mathrm{b}]\}$, and the lower integral of f , denoted $\underline{\int_{a}^{b}} f(x) d x$, is defined by $\int_{a}^{b} f(x) d x=\operatorname{lub}\{\mathrm{L}(\mathrm{f}, \mathrm{P}) \mid \mathrm{P}$ is a partition of $[\mathrm{a}, \mathrm{b}]\}$. |
| Lemma 5.4.9 | Let $[\mathrm{a}, \mathrm{b}] \subseteq \mathbb{R}$ be a non-degenerate closed bounded interval, and let $\mathrm{f}:[\mathrm{a}, \mathrm{b}] \rightarrow \mathbb{R}$ be a function. Suppose that f is bounded. Then the upper integral and lower integral of $f$ always exist, and $\underline{\int_{a}^{b}} f(x) d x \leq \overline{\int_{a}^{b}} f(x) d x$ |
| Proper Integral <br> (Theorem 5.4.10) | Let $[\mathrm{a}, \mathrm{b}] \subseteq \mathbb{R}$ be a non-degenerate closed bounded interval, and let $f:[a, b] \rightarrow \mathbb{R}$ be a function. Suppose that $f$ is bounded. Then $f$ is integrable if and only if $\underline{\int_{a}^{b}} f(x) d x=\overline{\int_{a}^{b}} f(x) d x$ <br> and if this equality holds then $\int_{a}^{b} f(x) d x=\underline{\int_{a}^{b}} f(x) d x=\overline{\int_{a}^{b}} f(x) d x$ |
| Continuous $\rightarrow$ Integrable <br> (Theorem 5.4.11) | Let $[\mathrm{a}, \mathrm{b}] \subseteq \mathbb{R}$ be a non-degenerate closed bounded interval, and let $f:[a, b] \rightarrow \mathbb{R}$ be a function. If $f$ is continuous, then $f$ is integrable. |

## Ch. 5.5 Further Properties of the Reimann Integral

| Axiom / Theorem / Lemma / Definition | Description |
| :---: | :---: |
| $g \circ f$ is Integrable <br> (Theorem 5.5.1) | Let $[\mathrm{a}, \mathrm{b}] \subseteq \mathbb{R}$ be a non-degenerate closed bounded interval, let D $\subseteq \mathbb{R}$ be a set and let $\mathrm{f}:[\mathrm{a}, \mathrm{b}] \rightarrow \mathbb{R}$ and $\mathrm{g}: \mathrm{D} \rightarrow \mathbb{R}$ be functions. Suppose that $f$ is integrable, and that $f([a, b]) \subseteq D$. <br> 1. If $g$ is uniformly continuous and bounded, then $g \circ f$ is integrable. <br> 2. If $D$ is a non-degenerate closed bounded interval and $g$ is continuous, then $g \circ f$ is integrable. |
| Example 5.5.2 | Let $\mathrm{f}, \mathrm{g}:[0,1] \rightarrow \mathbb{R}$ be defined by $f(x)=1$ for all $x \in[0,1]$, and $g(x)=$ $(1$, if $x=0 x$, if $x \in(0,1]$. Then $(f / g)(x)=(1$, if $x=0,1 / x$, if $x \in(0,1]$. <br> We know by Example 5.2.6 (1) that $f$ is integrable. The function $g$ is also integrable, as can be seen by combining Exercise 5.2.6 and Exercise 5.3.3 (3). However, even though $\mathrm{g}(\mathrm{x}) \neq 0$ for all $\mathrm{x} \in[0,1]$, the function $f g$ is not integrable, because integrable functions are bounded by Theorem 5.3.3, and yet $f \mathrm{~g}$ is not bounded, a fact that is evident by looking at the graph of f g , and is proved in Example 3.2.6. |
| Definition 5.5.3 | Let $A \subseteq \mathbb{R}$ be a set, and let $f: A \rightarrow \mathbb{R}$ be a function. The function $f$ is bounded away from zero if there is some $P>0$ such that $\|f(x)\| \geq P$ for all $x \in A$. |
| What is Integrable <br> (Theorem 5.5.4) | Let $[\mathrm{a}, \mathrm{b}] \subseteq \mathbb{R}$ be a non-degenerate closed bounded interval, and let $\mathrm{f}, \mathrm{g}:[\mathrm{a}, \mathrm{b}] \rightarrow \mathbb{R}$ be functions. Suppose that f and g are integrable. <br> 1. $\mathrm{f}^{\mathrm{n}}$ is integrable for all $\mathrm{n} \in \mathbb{N}$. <br> 2. fg is integrable. <br> 3. If g is bounded away from zero, then $\mathrm{f} / \mathrm{g}$ is integrable. |
| Absolute Value of Integral (Theorem 5.5.5) | Let $[\mathrm{a}, \mathrm{b}] \subseteq \mathbb{R}$ be a non-degenerate closed bounded interval, and let $\mathrm{f}:[\mathrm{a}, \mathrm{b}] \rightarrow \mathbb{R}$ be a function. If f is integrable, then $\|\mathrm{f}\|$ is integrable and $\left\|\int_{a}^{b} f(x) d x\right\| \leq \int_{a}^{b}\|f(x)\| d x$ |
| Theorem 5.5.6 | Let $\mathrm{D} \subseteq \mathrm{C} \subseteq \mathbb{R}$ be non-degenerate closed bounded intervals, and let $f: C \rightarrow \mathbb{R}$ be a function. If $f$ is integrable, then $\left.f\right\|_{D}$ is integrable. |
| Intermediate Bound (Theorem 5.5.7) | Let $[\mathrm{a}, \mathrm{b}] \subseteq \mathbb{R}$ be a non-degenerate closed bounded interval, let $\mathrm{c} \in$ $(\mathrm{a}, \mathrm{b})$ and let $\mathrm{f}:[\mathrm{a}, \mathrm{b}] \rightarrow \mathbb{R}$ be a function. <br> 1. $f$ is integrable if and only if $\left.f\right\|_{[a, c]}$ and $\left.f\right\|_{[c, b]}$ are integrable. <br> 2. If $f$ is integrable, then $\int_{a}^{b} f(x) d x=\int_{a}^{c} f(x) d x+\int_{c}^{b} f(x) d x$ |

| Swap Bounds / Same Bounds (Definition 5.5.8) | Let $[\mathrm{a}, \mathrm{b}] \subseteq \mathbb{R}$ be a non-degenerate closed bounded interval, and let $f:[a, b] \rightarrow \mathbb{R}$ be a function. Suppose that $f$ is integrable. <br> Let $\int_{a}^{b} f(x) d x$ be defined by $\int_{b}^{a} f(x) d x=-\int_{a}^{b} f(x) d x$ <br> and let $\int_{a}^{a} f(x) d x$ be defined by $\int_{a}^{a} f(x) d x=0$ |
| :---: | :---: |
| Split Bounds of Integration (Corollary 5.5.9) | Let $\mathrm{C} \subseteq \mathbb{R}$ be a closed bounded interval, and let $\mathrm{f}: \mathrm{C} \rightarrow \mathbb{R}$ be a function. Let $\mathrm{a}, \mathrm{b}, \mathrm{c} \in \mathrm{C}$. If f is integrable, then $\int_{a}^{b} f(x) d x=\int_{a}^{c} f(x) d x+\int_{c}^{b} f(x) d x$ |

## Ch. 5.6 Fundamental Theorem of Calculus

| Axiom / Theorem / Lemma / Definition | Description |
| :---: | :---: |
| Example 5.6.1 | (1) Let $f:[0,2] \rightarrow \mathbb{R}$ be defined by $f(x)=x$ for all $x \in[0,2]$. Let $F$ : $[0,2] \rightarrow \mathbb{R}$ be defined by $F(x)=\int_{1}^{x} f(t) d t$ |
|  | (2) Let $\mathrm{h}:[0,2] \rightarrow \mathbb{R}$ be defined by $\mathrm{h}(\mathrm{x})=(1$, if $\mathrm{x} \in[0,1] 2$, if $\mathrm{x} \in$ (1,2]. |
| Fundamental Theorem of Calculus Version I <br> (Theorem 5.6.2) | Let $I \subseteq \mathbb{R}$ be a non-degenerate interval, let a $\in I$ and let $f: I \rightarrow \mathbb{R}$ be a function. Suppose that $\left.f\right\|_{\mathrm{c}}$ is integrable for every non-degenerate closed bounded interval $C \subseteq I$. Let $F: I \rightarrow \mathbb{R}$ be defined by $F(x)=\int_{a}^{x} f(t) d t$ <br> for all $x \in I$. <br> Let $\mathrm{c} \in \mathrm{I}$. <br> If $f$ is continuous at $c$, then $F$ is differentiable at $c$ and $F^{\prime}(c)=f(c)$. If $f$ is continuous, then $F$ is differentiable and $F^{\prime}=f$. |
| Continuous $\rightarrow$ <br> Antiderivative <br> (Corollary 5.6.3) | Let $\mathrm{I} \subseteq \mathbb{R}$ be a non-degenerate interval, and let $\mathrm{f}: \mathrm{I} \rightarrow \mathbb{R}$ be a function. <br> If $f$ is continuous, then $f$ has an antiderivative. |
| Fundamental Theorem of Calculus Version II <br> (Theorem 5.6.4) | Let $[\mathrm{a}, \mathrm{b}] \subseteq \mathbb{R}$ be a non-degenerate closed bounded interval, and let $f:[a, b] \rightarrow \mathbb{R}$ be a function. Suppose that $f$ is integrable and $f$ has an antiderivative. If $\mathrm{F}:[\mathrm{a}, \mathrm{b}] \rightarrow \mathbb{R}$ is an antiderivative of f , then $\int_{a}^{b} f(x) d x=F(b)-F(a)$ |
| Example 5.6.5 | (1) Let $\mathrm{f}: \mathbb{R} \rightarrow \mathbb{R}$ be defined by $f(x)=\left(x^{2} \sin 1 / x^{2}\right.$, if $x \neq 00$, if $x=0$. |
|  | (2) Let $h:[0,2] \rightarrow \mathbb{R}$ be defined by $h(x)=(1$, if $x \in[0,1], 2$, if $x \in$ (1,2]. |
| Example 5.6.6 | (1) Let $\mathrm{g}:[0,2] \rightarrow \mathbb{R}$ be defined by $\mathrm{g}(\mathrm{x})=\mathrm{x}^{2}$ for all $\mathrm{x} \in[0,2]$. |
|  | (2) $\int_{-1}^{1} \frac{1}{x^{2}} d x$ |
